Synopsis

Die Arbeit stützt sich wie bei den früher erschienenen Lieferungen der Symbolae Afghanicae auf die Mehrzahl der seit dem Erscheinen von Boissier's Flora Orientalis in Afghanistan zusammengebrachten Sammlungen. Zu den in den früheren Lieferungen bearbeiteten Sammlungen kommen noch mehrere neue, unter anderen die von HEDGE und WENDELBO (1962) und von RECHINGER (1962) angelegten. Die vorliegende Lieferung enthält die Bearbeitung der Cyperaceen durch M. RAYMOND (Montreal) und der Gramineen durch N. C. Bor (Kew) und A. MELDERIS (London).

Die Bearbeitung der Cyperaceen umfasst 95 Arten, darunter vier neue. Der Artenreichtum konzentriert sich besonders auf die vorwiegend dem himalayischen Florengebiet angehörenden Landschaften Nuristan und das zu West-Pakistan gehörige Chitral. Der Formenkreis der *Carex stenophylla* wird kritisch untersucht und neu gegliedert. Für alle Arten werden Bestimmungsschlüsse gegeben. Die Bearbeitung der Gramineen umfasst 270 Arten, darunter sieben neue. Die Gramineen sind neben den Compositen und Leguminosen eine der artenreichsten Familien der afghanischen Flora. Der Endemismus ist jedoch bei den Gramineen verhältnismässig schwach ausgesprägt.

Introduction

“Symbolae Afghanicae” was initiated by plant collections made by L. EDELBURG and M. KØIE on “The 3rd Danish Expedition to Central Asia”.

In addition to these collections there have been included in part I. *Labiatae* (1954) the following collections: J. L. CHAWORTH-MUSTERS in Herb. of the British Museum, London; J. M. HONIGBERGER in Herb. of the Naturhistorisches Museum, Wien; H. F. NEUBAUER in Herb. of the Naturhistorisches Museum, Wien; W. KOELZ in United States National Herbarium, Washington DC., formerly at the Plant Industry Station, Beltsville, Maryland. Part one contains also a survey of plant-collecting in Afghanistan.

At the time of printing of part II. of the *Symbolae Afghanicae*, *Compositae* (1955), further collections from Afghanistan were received for determination, namely those of G. KERSTAN and A. SCHEIBE, Deutsche Hindukuschexpedition 1935 in Herb. of the Martin Luther Universität in Halle and O. H. VOLK, private collection, Würzburg. It was, however, too late to include the enumeration of the *Compositae* of these collections in the publication. As to the vast genus *Cousinia*, ALEXANDER GILLI having made extensive collections in Afghanistan (in Herb. of the Naturhistorisches Museum, Wien) between 1949 and 1951 agreed to hand over to me his material of that genus for determination and publication. Most of the results of his activities have been worked out and published separately by himself.

In part III of *Symbolae Afghanicae*, *Leguminosae*, all the above mentioned collections are being included. The same is true for part IV, including the following families: *Pteridophyta*, *Cruciferae*, *Saxifragaceae*, *Geraniaceae*, *Linaceae*, *Guttiferae*, *Onagraceae*, *Primulaceae*, *Apocynaceae*, *Asclepiadaceae*, *Convolvulaceae*, *Solanaceae*, *Scrophulariaceae*, *Rubiaceae*, *Dipsacaceae*, as well as *Liliaceae*, *Amaryllidaceae*, *Dioscoreaceae*, *Iridaceae*, and *Orchidaceae*. Among the smaller collections occasionally mentioned in part IV and V, and also now in the present part VI of *Symbolae Afghanicae* the following should be mentioned: K. LINDBERG, private collection, Lund, R. MEINERTZHAGEN and W. THESIGER, British Museum, London, P. WENDELBO, Herbarium of the University Bergen, and I. HEDGE, Herbarium of the Royal Botanic Garden, Edinburgh.

HONIGBERGER's specimens collected in 1833 are probably the oldest plant collection from Afghanistan. Most of them have not at all or only provisionally been named and they are inserted since many years in the Vienna Herbarium. Unfortunately their labels do not give any information excepted “Cabul-HONIGBERGER”. Most probably “Cabul” is to be understood in the sense of “Regnum Cabulicum”, the plants thus labelled do not necessarily originate from the neighbourhood of Kabul City.

Duplicates of many of the above mentioned collections have been deposited in the Herbarium of the Naturhistorisches Museum, Wien, the Grasses collected by

KØIE and EDELBerg in the Herbarium of the University of Copenague, in the Herbarium of the Royal Botanic Gardens, Kew, and in British Museum (Natural History), London.

Many of the localities referred to in this work are not shown on any map. Others will be difficult to identify because of the considerable discrepancies in orthography. In the absence of established orthographic rules, we have given the localities in the spelling that has been found on the labels. A complete list of more exact geographical locations cannot be prepared until the treatment has been completed because new material has been coming in all the time. For preliminary orientation we have divided Afghanistan into seven parts: N, NE, E, SE, SW, NW and C as indicated on the map. These geographical abbreviations are placed in front of the localities given. Nuristan has been segregated from the north-east part of the country, mainly because it is a well defined area from which a particularly large number of plants has been collected, but also because the monsoon rain renders the vegetation of Nuristan different from that of most of the other parts of Afghanistan. Otherwise no attempt has been made to divide the country by plant geography.

Data of habitats, etc. have been cited in the language used by the collector on the label.

Whereas in most of the earlier parts of the *Symbolae Afghanicae* enumerations only of the herbarium material recently obtained have been presented, the treatments published in part V as well as in the present part VI, however, cover all the species reported from Afghanistan. Keys to genera and species have been worked out in *Cyperaceae* by MARCEL RAYMOND. In many cases species reported from neighbouring countries, e. g. from Chitral, Swat, Peshawar and Kurram, as well as Balouchistan in the East, and in Khorasan in the West have been included too because their occurrence in Afghanistan is to be expected.

The names of the collectors are abbreviated as follows; indication of herbaria is given in brackets: AmSEL is H. G. AMSEL (W); B. L. is S. A. BOWES LYON (BM); CH.-M. is J. L. CHAWORTH-MUSTERS (BM); Cn is C. DE B. CODRINGTON (BM); E is L. EDELBerg (C, W); G. is A. GILLI (W); H is HONIGBERGER (W); HdG. is I. HEDGE (E, W); K is M. KØIE (C, W); Kn is G. KERSTAN (HAL); Kz is W. KOELZ (US); L is K. LINDBERG (W); M. is R. MEINERTZHAGEN (BM); N is H. F. NEUBAUER (W); REPP is G. REEP (W); SCH is A. SCHEIBE (HAL); St is J. D. A. STAINTON (BM); Th is W. THESIGER (BM); V is O. H. VOLK (W); WDB is P. WENDELBO (BG, E, O, W). The specimens collected by K. H. RECHINGER (RECH, W) in 1962 have been taken up too.

For herbaria the internationally recognized abbreviations as indicated in Index Herbariorum have been used.

Photographs of Grasses have been prepared by Messrs. M. G. SAWYERS and P. GREEN of Photographic Studio, British Museum (Natural History), London.

The plant families will be published in the sequence in which the treatment is completed. It is intended to conclude the work with a survey of Afghanistan's vegetation.

The typescript for the press was prepared by A. PATZAK, Wien.

CYPERACEAE

by MARCEL RAYMOND,¹⁾ Montreal.

The material enumerated below contains 95 species. It includes actual specimens submitted by Dr. K. H. RECHINGER, borrowed from several herbaria, as well as reliable records taken in the botanical literature. The loan included the material collected by KERSTAN during the German Hindukush Expedition of 1935, partial results of which only have been published. The *Cyperaceae* have not appeared in print, though some of them have been determined by the late G. KUEKENTHAL. Present also was a nice set of specimens from Chitral, collected by STAINTON and BOWES LYON that add considerably to our knowledge of the Cyperaceous flora of that area. In some cases, as several species have been described with immature or fragmentary material, this beautifully prepared collection has given me the opportunity to write more complete descriptions of inadequately understood species. Years ago, my friend PER WENDELBO had given me duplicates of several of his own collection from Tirich Mir, so that I was already familiar with such species as *Carex chitralensis* NELMES, *C. Gilesii* NELMES and *C. Wendelboi* NELMES, to mention only these. Dr. M. KØIE was kind enough to send a very nice set, from various parts of Afghanistan. As several old collections labelled as coming from 'Afghanistan' or 'Kabul' have in fact been collected in Pakistan, the examination of all this material has often allowed me to confirm or reject the actual presence of such species in Afghanistan itself, though several old records have still to be authenticated by new material. GILLI's material, the basis of a recent publication, has also been examined, thanks to Dr. RECHINGER.

The following genera are represented: *Carex* (42 species), *Cyperus* (19 species), *Scirpus* (13 species), *Kobresia* (11 species), *Eleocharis* (6 species), *Bulbostylis* (1 species), *Fimbristylis* (1 species), *Eriophorum* (1 species), *Schoenus* (1 species).

Carex alsia and *C. austro-afghanica* are described as new, as well as *Kobresia afghanica*. *Carex sanguinea* is transferred to the genus *Kobresia* and *Scirpus maritimus* var. *orientalis* LITW. is raised to specifical rank as *S. Schmidii*. Some minor transfers and taxa are also proposed.

The following enumeration shows that phytogeographically speaking NE. Afghanistan and Chitral, the richest area in species of *Carex* notably, is the western-

¹⁾ Curator, Montreal Botanical Garden, Canada.

most extension of the Himalayan flora, with several endemics of restricted range. The still poorly known Northern district shows floristic affinity with Turkestan and Pamiro-Alaj, whereas the Western district is the continuation of the Iranian flora. *Carex Halleriana*, ranging from Portugal through Iran and Afghanistan (one gathering) to Sind, indicates a faint Mediterranean influence. If Chitral is removed from the picture, the actual Cyperaceous flora of Afghanistan sensu stricto is a relatively poor one.

- 1a. Flowers unisexual. Female flowers (nut, achene) enclosed in a more or less flask-shaped closed perigynium 2
- b. Flowers hermaphrodite. Female flowers (nut, achene) subtended by a scale 3
- 2a. Female flowers enclosed in an incompletely closed perigynium..... *Kobresia*
- b. Female flowers enclosed in a completely closed flask-shaped perigynium.. *Carex*
- 3a. Spikelets flat, the scale distichous *Cyperus*
- b. Spikelets terete, the scales spirally arranged..... 4
- 4a. Spikelets mostly 1–3-flowered, with several empty basal scales *Schoenus*
- b. Spikelets several flowered, with 1–2 empty basal scales 5
- 5a. Spikelets solitary, at the end of a leafless culm. Style-base enlarged and persistent *Eleocharis*
- b. Spikelets mostly several, variously grouped. Style-base caducous..... 6
- 6a. Style-base flattened, often fimbriate..... *Fimbristylis*
- b. Style-base not flattened, smooth..... 7
- 7a. Style-base leaving a button-like scar on top of the achene. Plants mostly hairy *Bulbostylis*
- b. Style-base not button-like 8
- 8a. Spikelets variously grouped, terminal or pseudolateral, even solitary. Bristles several or Ø, shorter than, or as long as, the achene..... *Scirpus*
- b. Spikelets small, very numerous, in a terminal compound umbelliform panicle. Bristles overtopping the achene. *Eriophorum*

Cypereae

***Cyperus* L.**

- 1a. Axis of spikelets continuous 2
- b. Axis of spikelets articulate and broadly winged. Spikes hemispherical. Scales 2,5 mm long, 3-5-nerved. Nutlets oblong. Small tufted annual 2-20 cm high..... *C squarrosus* L.
- 2a. Stigmas 3. Nutlets trigonous 3
- b. Stigmas 2. Nutlets lenticular compressed or biconvex..... 15
- 3a. Spikelets on a rather long axis, spikelike 4
- b. Spikelets on a very short axis, digitate or fasciculate 10
- 4a. Axis of spikelets with margin of scales decurrent at base, conspicuously winged at last. Style long..... 5
- b. Axis of spikelets unwinged or narrowly margined. Style short 9

- 5a. Spikes cylindrical. Axis broadly winged; wings coloured so often *C. imbricatus* RETZ
- b. Spikes broad-ovate or turbinate. Wings of axis hyaline 6
- 6a. Rhizome horizontal with rather long stolons. Scales densely imbricate..... 7
- b. Rhizome with rather slender stolons or short suckers. Scales elliptical obtuse *C. eleusinoides* KUNTH
- 7a. Rhizome creeping. Stolons lignescens. Scales keeled, obscurely few-winged 8
- b. Rhizome fibrous. Stolons thin. Scales concave, scarcely keeled, conspicuously many-nerved *C. esculentus* L.
- 8a. Stolons tuberiferous *C. rotundus* L.
- b. Rhizome lignescens, creeping; no tuberiferous stolons present ... *C. longus* L.
- 9a. (4) Spikelets loosely spicate. Scales loosely arranged, broadly obovate or ovate, rounded at apex, 5–7-nerved. Nutlets nearly as long as scales .. *C. Iria* L.
- b. Spikelets densely spicate. Scales densely imbricate, ovate, cuspidate or rounded at apex, 5–13-nerved. Nutlets 1/2 as long as scales *C. glaber* L.
- 10a. Anthela spreading 11
- b. Anthela capitate-contracted 12
- 11a. Spikelets 5–15, loosely capitate. Scales ovate, blackish-brown....*C. fuscus* L.
- b. Spikelets numerous, densely capitate. Scales orbicular-obovate, chestnut-brown, hyaline at margin *C. difformis* L.
- 12a. Spikelets turgid. Scales inconspicuously carinate towards apex *C. conglomeratus* ROTTB.
- b. Spikelets compressed. Scales conspicuously carinate 13
- 13a. Culms long. Scales muticous obtuse *C. niveus* RETZ.
- b. Culms very short. Scales ending in a conspicuous muero *C. Michelianus* (L) LINK
- 14a. (2) Nutlets dorsally compressed, facing the axis 15
- b. Nutlets laterally compressed, their angles facing the axis 16
- 15a. Anthela loose, rays rather long. Scales veined *C. serotinus* ROTTB.
- b. Anthela capitate-contracted, not more than 1 mm wide. Scales not veined *C. laevigatus* L.
- 16a. Outermost cells hexagonal. Nutlets reticulate or punctulate 17
- b. Outermost cells rectangular oblong. Nutlets undulate or muricate at base and towards apex *C. flavesens* L.
- 17a. Scales never sulcate 18
- b. Scales conspicuously sulcate *C. sanguinolentus* VAHL
- 18a. Scales obtuse or acute, never ending in a recurved muero *C. globosus* ALL.
- b. Scales truncate at apex or ending in a recurved muero *C. pumilus* L.

C. conglomeratus ROTTB. – ‘Balouchistan’ (ELLIOTT).

C. conglomeratus ROTTB. var. *Aucherii* (JAUB. et SPACH) C. B. CLARKE – Common in nearby Persia and to be expected in SW.-Afghanistan.

C. conglomeratus ROTTB. var. *effusus* (ROTTB.) KUEKENTHAL, — ‘Afghanistan’ (AITCH. 36). — **Pakistan:** Balouchistan: Sibi (LACE).

Desert and sandy places of Africa and SW. Asia, eastwards to India. A difficult group to deal with, where BOECKELER recognized 9 species, all treated by KUEKENTHAL as varieties or forms of a single one.

C. difformis L. — **E:** Prov. Khost: Wuzak (V. 1072). Arghandab bei Kabul (V. 1352). Kabul (AKHTAR 422). ‘Afghanistan’ (GRIFF. 6155 p. p.).

C. eleusinoides KUNTH — **E:** Kabul (GRIFF. 28, 1267, 6199).

C. esculentus L. — **NE:** Khanabad, 700 m (Kz. 12201).

C. flavescens L. — ‘Afghanistan’ (AITCH. 964).

C. fuscus L. — **N:** Mazar-i Sharif: Aqtscha (N. 1950/131). - 5a. Style-base elongate, longer than broad *E. palustris* (L.) R. et S.
- b. Style-base mitrate, broader than long *E. mitracarpa* STEUD.

The genus *Eleocharis* is a difficult one to deal with, and old views on several wide-ranging species have to be revised. The material from Afghanistan is not easy to sort out. Apparently, the most common species is *Eleocharis mitracarpa* STEUD., which turns out either as dwarf rigid plants or as tall plants with spongy wide culms, the spikes varying also in color from white to brown. Yet the mitriform style-base is unmistakable.

The line of demarcation between *E. palustris* and *E. uniglumis* is difficult to draw and the characters based on the number and shape of the sterile scales are not always reliable. ZINSERLING’s treatment for the Flora URSS includes no less than 21 species in the *E. palustris*-group. One of his names has been retained as variety.

Eleocharis acicularis (L.) R. Br. and *E. carniolica* KOCH, reported by GILLI, FEDDES Repert. spec. nov. 64: 214–215 (1962) as occurring in Afghanistan are both based on specimens of *E. quinqueflora* (HARTM.) SCHWZ., the correct name for the well known *E. pauciflora* (LIGHTF.) LINK. Of the two specimens of *Eleocharis palustris* (L.) R. et S. that he mentions, one belongs to it, whereas the other represents *E. mitracarpa* STEUD., a frequent species in Southwestern Asia.

E. atropurpurea (RETZ.) KUNTH (Syn. *Scirpus atropurpureus* RETZ.). – PAKISTAN: Kurram: Shalizan, growing with *Scirpus juncoides* ROXB., in rice-fields (AITCH. 603).

E. geniculata (L.) R. et S. (Syn. *Scirpus geniculatus* L., *S. caribaeus* ROTTB.,

Eleocharis capitata R. BR., *E. caribaea* (ROTTB.) S. F. BLAKE). — **Pakistan:** Balouchistan (STOCKS).

E. mitracarpa STEUD. (Syn. *E. crassa* FISCH. et MEY., *E. Kitamurana* T. KOYAMA, Act. Phytotax. et Geobot. 17: 48, fig. 1 (1957), *E. uniglumis* (LINK) SCHULT. var. *latrix* T. KOYAMA, Act. (RECH. 16961). — **Pakistan:** From Thal to Kurram (AITCH. 316). In collibus supra Dargai, 400 m (RECH. 19623). Inter Saidu Sharif et Malakand, 800 m (RECH. 19618).

***Scirpus* L.**

- 1a. Spike solitary, terminal, small, 3–4 mm long, few-flowered. In loosely stoloniferous small tufts *S. pumilus* VAHL
- b. Spikelets several, variously arranged 2
- 2a. Stem filiform, 3–20 cm high, with 1–3 small spikelets. Hypogynous bristles Ø. Annual *S. setaceus* L.
- b. Stem not filiform 3
- 3a. Inflorescence terminal, subtended by 1 to several bracts 4
- b. Inflorescence pseudolateral, one of the bract erect as if continuing the stem 8
- 4a. Inflorescence distichous, congested, subtended by 1 short bract *S. planifolius* GRIMM.
- b. Inflorescence umbellate, subtended by 1 to several leafy bract. Roots with internodes swollen in woody tubers 5
- 5a. Spikelets 1–3 ovoid, straw-coloured, sometimes whitish. Glumes nearly glabrous *S. affinis* ROTH
- b. Spikelets pale to deep brown. Glumes minutely pubescent 6
- 6a. Spikelets narrowly cylindrical 1–2 cm long and less than 6 mm thick, in dense groups at the end of the rays *S. tuberosus* DESF.
- b. Spikelets ovoid, more than 6 mm thick 7
- 7a. Achene white. Hypogynous bristles Ø *S. Schmidii* RAYMOND
- b. Achene straw-colored. Hypogynous bristles 3–6 *S. maritimus* L.
- 8a. Spikelets 1–9 aggregated in a dense lateral head located at the middle of the often septate stem *S. Roylei* (NEES) PARKER
- b. Spikelets located below the top of the stem 9
- 9a. Annual, in tufts. Spikelets 8–10 cm long *S. juncoides* ROXB.
- b. Perennial species 10
- 10a. Hypogynous bristles Ø. Spikelets congested into crowded spherical heads *S. Holoschoenus* L.
- b. Hypogynous bristles usually present. Spikelets arranged otherwise 11
- 11a. Stem triquetrous *S. triqueter* L.
- b. Stem terete, sometimes triquetrous below the inflorescence 12
- 12a. Bristles soft and plumose *S. litoralis* SCHRAD
- b. Bristles harsh and scabrid *S. lacustris* L. agg.

S. affinis ROTH (Syn. *S. strobilinus* ROXB., *S. maritimus* L. var. *macer* BOECK., *S. maritimus* L. var. *affinis* (ROTH) C. B. CLARKE, *Bolboschoenus affinis* (ROTH) DROBOV). — **C:** Kamard, 6000 ft. (Kz. 13602). — **SW:** Dilaram, 1100 m (K. 3345). — **SE:** 15 km E Kandahar (KITAMURA 36). — **E:** W of Kabul (KITAMURA 40 p.p.). — **C:** Doab, 5000 ft. (Kz. 13510, KITAMURA 33). — ‘Afghanistan’ (AITCH. 421, 788, 868).

S. affinis ROTH f. ***maritimoides*** (DROBOV) RAYMOND, comb. nov. (Syn. *Bolboschoenus affinis* DROBOV var. *maritimoides* DROBOV, Trav. Mus. Bot. Acad. Petersb. 16: 140 (1916), *S. vulpinicolor* KOYAMA). – **E:** W of Kabul (KITAMURA 40 p.p.).

In this form, the rays are elongated and the yellow spikes numerous whereas in Indian and Indo-Chinese specimens, the inflorescence is reduced to 1–2, nearly white, large spikes.

S. Holoschoenus L. – **SW:** Herat to Shin Dand, 1400 m (K. 3941). 60 km S of Herat, 1600 m (K. 2276). Dilaram, 1100 m (K. 3348). Tuki, 4500 ft., clumps along spring (Kz. 13117). – **E:** Ghazni: Sang-i Masha, 2500 m (RECH. 17464). Kabul: Zwischen Tang-i Saidan und Lallandar, 1810 m (G. 252). Gulbagh, Kabul, 1800 m (G. 251). – **C:** Doab (V. 520, KITAMURA 57).

S. juncoides ROXB. (Syn. *S. erectus* (non POIR.) plurim. auct.). – **Pakistan:** Kurram, Shalizan, 6000 ft. (AITCH. 420). – **C:** Kamard, 6000 ft., along stream (Kz. 13587). – **E:** Zwischen Tang-i Saidan und Lallandar, 1810 m (G. 252, 253). Gulbagh, Kabul, 1800 m (G. 251-b).

S. lacustris L. var. ***luxurians*** (MIQ) RAYMOND, comb. nov.

(Syn. *S. Tabernaemontani* GMEL. f. *luxurians* MIQUEL, Ann. Mus. Bot. Batav. 2: 143 (1856), *S. Hyppoliti* V. KRECZ., Not. Syst. Herb. Inst. Bot. Acad. Sci. URSS. 7 (I): 28 (1937), *S. lacustris* L. ssp. *validus* (VAHL) KOYAMA var. *luxurians* (MIQ.) KOYAMA, Can. Journ. Bot. 40: 927 (1962), *S. Tabernaemontani* plurim. auct. asiat.). – **EN:** Khanabad, 12000 ft., by stream (Kz. 12231). Rustak, 6000 ft. (Kz. 13138). – **E:** Ghazni: Ad lacum Sabzab, inter Okak et Behzud (Diwal Kol), 2800 m (RECH. 17907, 17913). Kabul, E Tscharasiah, 1740 m (G. 255, 256). Dehmasang, Dar-ul fanun, Gusargah, 1770–1780 m (G. 257, 158). Jallalabad (KITAMURA 59). Between Ghazni and Kabul (KITAMURA 25). – **C:** Doab, 1700 m, in spring stream (Kz. 13534). Kamardtal, am rechten Ufer des Surch, W Doab, 1620 m (G. 254). Kamard, 6000 ft., in stream (Kz. 13593, 13607). – Panjao, 2800 m (K. 2742). – **Pakistan:** Kurram Valley (AITCH. 312, 465, 689).

Var. *luxurians* seems to link var. *validus* (VAHL) KUEKENTHAL and var. *Tabernaemontani* (GMEL.) DOELL. Closely related to each other, they more or less intergrade. Together with var. *tenuiculmis* SHELDON (Syn. *S. heterochaetus* CHASE), which is strictly North American, they are at best treated as varieties. KOYAMA (loc. cit. 926–928) has recognized 3 subspecies and 3 varieties in the *Scirpus lacustris* complex.

S. lacustris L. var. *Tabernaemontani* (GMEL.) DOELL (Syn. *S. Tabernaemontani* GMEL.). – **N:** Khanabad, 400 m (Kz. 12231). Rustak, 650 m (Kz. 13138). Kunduz: In paludosis fluvii Kunduz, 400 m (RECH. 16054). In valle fluvii inter Doshi et Doab, 800–1300 m (RECH. 16582). – **C:** Kamard, NW Doab, 2000 m (Kz. 13593, 13607). Doab, 1700 m (Kz. 13534).

S. litoralis SCHRAD. (Syn. *S. subulatus* VAHL, *S. thermalis* TRABUT, *S. litoralis* SCHRAD. var. *subulatus* (VAHL) CHIOVENDA (1928), KOYAMA (1958). – **SW:** Inter Farah et Seistan, 600 m (K. 4345). – **SE:** Pirzada, nr. Kandahar, 980 m (K. 2185). Zwischen Ghirishk und Hilmend-Fluss, 880 m (G. 259). – **Pakistan:** From Thal to Kurram (AITCH. 312, 465).

Even if BEETLE (Amer. Journ. Bot. 28: 692 (1941) terms *Scirpus subulatus* VAHL "a clear-cut species from Afghanistan", it has been considered by various authors as identical to *S. litoralis* SCHRAD., of which *S. pectinatus* ROXB. is also a synonym. The only difference, if of any importance, resides in the culm, trigonous in *S. litoralis*, terete in *S. subulatus*, though slightly angled below the inflorescence. For another opinion, see TOWNSEND in Kew Bull. 1963: 415-418.

S. maritimus L. - **N:** Tuloqan (V. 594-a). - **C:** Kamard, 6000 ft. (Kz. 13602). Wazirabad (N. 1951/124-a). - **SE:** E von Kandahar, 1100 (Kn. 221). - **E:** Kabul: Paghman, 6000 ft. (Kz. 11450). Koh-i Baba, in latere austro-orientali jugi Hadjigak, 3000 m (RECH. 18540). Unai Pass, 2800-3100 m, feuchter Rasen (G., V. 2108). Farakulum (K. 3339). Hauz-i Mahiha, 2900 m (K. 2492). Lal-i Zarjangal, 2500 m (K. 3341). - **Pakistan:** Chitral: Khot An, N of Mastuj, 1000 ft., between Turikho and Mastuj Rivers (St. 2858). Mastuj, 2500 m (St. 2484). Swat: Utror, 2500 m (RECH. 19563).

S. planifolius GRIMM. var. *tenuis* (GILLI) RAYMOND, comb. nov. (Syn. *Blymus tenuis* GILLI, FEDDES Repert. spec. nov. 46: 48 (1939). - **C:** Bamian: Kamard-Tal, rechtes Ufer des Surch, W Doab, 1620 m (G. 275).

Scirpus planifolius is a very variable species. In the Flora of British India (660–661, 1894), C. B. CLARKE, under *Scirpus Caricis* RETZ., recognized var. *brevifolia* (DECNE.) C. B. CLARKE, var. *sikkimensis* C. B. CLARKE and var. *dissita* (DUTHIE) C. B. CLARKE. These taxa have never been discussed and with such a wide-ranging species, variation is to be expected.

The synonymy of this species is much involved. It was first described as *Schoenus compressus* L., but when transferred to *Scirpus*, the specifical epithet cannot be used, on account of the pre-existence of *Scirpus compressus* MOENCH (1794). See details in HYLANDER, Upps. Universit. Årsskr. 7: 92 (1945).

Young specimens of this protean species simulate various species of *Carex* Subgenus *Vignea* and are usually found in herbaria with *Carex divisa*. Judging from the specimens that have been turned to me for identification lately, the species is frequent in the Himalaya and extends to Yunnan. The following have been determined (in herb. Univ. Michigan): Kashmir, Ladak (KOELZ 6325, 6345); Lahul (KOELZ 587 p.p., 593, 620, 1029, 1303). Yunnan (these in herb. GRAY). Wei-si Hsien (WANG 67824). Li-kiang Hsien, 2300–2800 m (WANG 70542, 70589, 70892, 70922, 71318).

Nomochloa BEAUV. in LESTIBOUDOIS (1819), has been revived by BEETLE for the present species, whereas KUEKENTHAL cites *Nomochloa compressa* BEAUV. as a synonym of *Eleocharis ovata* (Bot. Jahrb. 75: 485 (1952).

The correct name of *Scirpus planifolius* MUHLENBERG (1817), an unfortunate later homonym, but a good North American species of Section *Baeothyron*, is *Scirpus verecundus* FERNALD.

S. pumilus VAHL (Syn. *S. alpinus* SCHLEICH., *Trichophorum pumilum* (VAHL) SCHINZ et THELL.). – NE: Nuristan: Oberes Ramgel-Tal bei Puschol, 2300 m (Kn. 1107). – E: Ghazni: Ad lacum Sabzak, inter Okak et Behzud (Diwal Kol), 2800 m (RECH. 17931). Kabul: Paghman, 2500 m (Kz. 12105). – C: Bamian: Band-i Amir, in ripa lacus, 2000–2800 m (RECH. 16321, V. 2847). Farakulum (K. 2613). – Pakistan: Chitral: Prope Mastuj in valle Yarkhun, 2040 m (Kz. 2047-a). Oberes Ramgel-Tal in der Nähe von Puschol, 2300 m, nasse Wiesen (Kn. 1107).

S. Roylei (NEES) PARKER (Syn. *Isolepis Roylei* NEES, *I. lupulina* NEES, *S. quinquefarius* BUCH-HAMILTON, *S. lupulinus* (NEES) ROSHEV.). – E: Kabul (C. B. CLARKE).

Scirpus Schmidii RAYMOND, stat. nov.

(Syn. *S. compactus* HOFFM. var. *orientalis* LITW. Herb. Fl. Ross. Fasc. 8, n° 2792 (1922) *Bolboschoenus compactus* (HOFFM.) DROBOV var. *orientalis* (LITW.) ROSHEV., non *Scirpus orientalis* OHWI, Acta Phytotax. et Geobot. 1: 76 (1932).

E grege *Scirpi maritimi* L. – Rhizoma in speciminibus nostris deficiens sed probabiliter durum, lignosum et tuberiferum. Culmi 15–45 cm alti, glaucescentes, striati, tricorni, angulis alato-scabridi. Folia subbasalia 3–4 mm lata, culmo breviora, glaucescentia, vaginis longis brunneis numerosis partem inferiorem culmorum tegentibus. Spiculae numerosae sessiles, ovoideae, 6–8 mm longae, in capitulum hemisphericum 1 cm longum, 2 cm latum dense congestae. Bracteae 2, 3–6 cm longae, basi paulum dilatatae, carinatae, carina et marginibus seabrae, demum deflexae. Squamae concavae, 5 mm longae, late ovatae, dorso et marginibus ciliatae, papyraceae, castaneae, subtiliter rubro-lineatae, nervo medio incrassato praeditae, in aristam recurvam sebram prolongatae. Achenium 3 mm longum, rhomboideum, basi attenuatum, trigonum aut interdum planoconvexum, nitidum, eburneum, demum

griseo-album, densissime cellulosum. Stigmata 3 (interdum 2). Styli basis incrassata. Setae hypogynae deficienes.

Afghanistan: E: Kabul: Kabul, Scirpo-Phragmiteta (VOLK 69-a, 827, 832). — **Persia:** E: Khorasan: Bar, 1780–2350 m (SCHMID 6288, Typus, G, Isotypus, W).

Scirpus compactus HOFFM. is merely a form of *Scirpus maritimus* L. with the rays of the normally umbellate inflorescence undeveloped. They often grow in the same colony. All species of section *Bolboschoenus* with a normal umbellate inflorescence exhibit a “congested” phase. On the other hand, *S. Schmidii* with an inflorescence normally without rays was wrongly associated with *S. compactus* HOFFM., the correct name of which is *S. maritimus* L. f. *compactus* (HOFFM.) P. JUNGE.

Scirpus Schmidii stands apart in the following manner: achene white, 3 mm long, no hypogynous bristles; bracts 2, reflexed; foliage glaucous. Its exact range is not known; it is probably scattered in the mountainous parts of Southwest and Inner Asia.

S. setaceus L. (Syn. *Isolepis setacea* (L.) R. BR.). — **E:** Ghazni: In jugo Sardalu W Qarabagh, 2300–2500 m (RECH. 17321). Kabul: Paghman, Berge oberhalb Beg-tut (G. 249). - b. Leaves 3–6 mm wide. Achene 4 mm long *K. sanguinea* (BOOTT) RAYMOND

***Kobresia afghanica* RAYMOND, spec. nov.**

Ser. nov. ***Longestigmatae*** RAYMOND. — Stigmata longissima, testacea, indurata, persistentia, ad quam *K. afghanica*, *K. laxa* et *K. sanguinea* pertinent.

Planta 6 cm longa, gracilis, tenuiter stolonifera, basi fibrillis stramineis deliciatulis praedita. Folia culmo breviora 1 mm lata plus minusve canaliculata. Inflorescentia spicata, 1,5–2 cm longa, oblongo-ovata. Spiculae propriae 5–6 sessiles, basilaribus distantibus, summis coaretatis. Bracteae squamiformes castaneae, late hyalinae, 3-nervis viridibus in aristam usque ad 1 cm longam evanescentibus praeditae. Prophyllum marginibus liberis sed anguste amplectens achenium lineari-oblongum brunneum, 3 mm longum, 0,75 mm latum. Stigmata 3 longissima, testacea, indurata, persistentia. Rachilla elongata, ad 7 mm.

Afghanistan: E: Panjshir (VOLK 160, Typus, W). Bagrami, Nedjerau-Tal, 2800 m, an schattigen Felswänden und an schattigen Quellen (NEUBAUER 1951/331, VOLK 2346, 2348). Oestlich vom Nedschrabtal, zwischen Sarobi und Gulbahar (GILLI 294, 295).

Looking superficially like *K. macrantha* BOECK. of western Tibet, that has a crowded inflorescence, 2 stigmas and a lenticular achene loosely invested by the prophyllum. In *K. afghanica*, the inflorescence is more elongate, the very narrow achene is closely invested by the boat-shaped, open prophyllum and crowned by the three long persistent brick-red stigmas. See note under *K. sanguinea* (BOOTT) RAYMOND.

K. capillifolia (DECNE.) C. B. CLARKE (Syn. *Elyna capillifolia* DECNE., *Kobresia scirpina* (non WILLD.) AITCH., *Elyna spicata* (non SCHRAD.) BOISS., *Kobresia capillifolia* (DECNE.) C. B. CLARKE var. *filiifolia* (TURCZ.) KUEKENTHAL. — **NE:** Nuristan: Minjan Pass, 12000 ft., in meadow (Kz. 12677). Auf einem Berg NNW von Kamdesch, 2800 m (G. 291). — **Pakistan:** Safed-Koh Range, on the tops of the hills from 11000 to 12000 ft. (AITCH. 230). **Chitral:** Ojhor, 36°04'N, 71°48'E, 12000 ft. (B. L. 863). Kiawas and Shendtoi, 11000 to 12000 ft. (AITCH. 410, 745).

The closely related *K. capilliformis* IVANOVA, with the achenes obovate, instead of elliptic, occurring frequently in the neighbouring Pamiro-Alaj district (sensu Fl. URSS), should be looked for confidently in Afghanistan.

K. curvata (BOOTT) KUEKENTHAL (Syn. *Carex curvata* BOOTT, *Kobresia Royleana* (NEES) BOECK. var. *bracteata* GILLI, FEDDES Repert. spec. nov. 64: 215 (1962).). — **NE:** Seitental der Pandjir-Schlucht bei Gulbahar, 1700 m (G. 292).

K. laxa NEES. — **NE:** Shingar, 2200 m, Porande-Tal, Seitental des Pandjir-Tales (G. 293). **Nuristan:** Kulam (Munui), im Kulam-Tal, 2150 m (Kn. 1062-b). Brubruts im oberen Kantivo-Tal, 2500 m (Kn. 947). — **Pakistan:** **Chitral:** Shokor Shal, 3600 m (WDB.). Drosh Gol, 35°33'N, 71°48'E, steep moist bank, 10500 ft. (B. L. 117). Bromboret Gol, 35°41'N, 71°38'E, edge of aquaduct, 6800 ft. (B. L. 649). Shishi Gol, E of Drosh, 7000 ft., on marshy ground (St. 2379). Mastuj, Baroghill Track, Lasam, 9000 ft., at edge of stream (St. 2951). Chitral, 5500 ft., on boggy ground (St. 2534, 2536).

K. pamiroalaica IVANOVA (Syn. *K. schoenoides* (non STEUD.) AITCH.). — **NE:** Nuristan: Minjan Pass, 13500 ft., clumps (Kz. 12748). Mamgel Pass, Ost-Seite, im oberen Schuk-Tal nach Aterschuker, 3800 m (Kn. 987). — **Pakistan:** Safed Koh Range, 11000–12000 ft. (AITCH. 301). **Chitral:** Chumarkhan Pass, E of Mastuj, 13000 ft., on open slopes (St. 2926, 2927, 2928). Zwischen Dorrah Pass und Babur, Pass-Sattel, 4500 m (Kn. 1536).

IVANOVA (l. c.) recognizes 5 species in the *Kobresia schoenoides* complex: *K. sibirica* TURCZ. (extending from the Urals through Arctic Asia to Olenek River and Tchukh Peninsula, south to Mongolia); *K. Smirnovii* IVANOVA (alpine regions of Altai, Tarbagatai and Dzungarian Alatau); *K. tibetica* MAXIM. (Himalaya, Tibet, Nan Mountains in C. China, and W. China); *K. pamiroalaica* IVANOVA (Pamiro-Alaj, W. Tian-Shan, Himalaya, Chitral, E. Afghanistan and W. Pakistan). The true *K. schoenoides* (C. A. MEYER) STEUDEL is restricted to the Caucasus and Asia Minor (Cilicia). To which should be added: *K. hyperborea* A. E. PORSILD (W. Arctic Canada, from the Mackenzie Delta, east to Boothia Peninsula) and *K. macrocarpa* CLOKEY (Mountains of Colorado, U.S.A.). The exact taxonomical position of the two American species, in regard to the five Asiatic ones, has still to be investigated. The first one seems to be identical to *K. sibirica* TURCZ.

IVANOVA's monograph being absent from several botanical libraries, part of her treatment of Series *Sibiricae* is adapted here:

1a. Mature achene shining	2
b. Mature achene dull	3

- 2a. Inflorescence mostly compound, ovate-elliptical, 5–8 mm wide.....
..... *K. pamiroalaica* IVANOVA
- b. Inflorescence mostly spicate, narrowly elliptical or cylindrical, 3–5 mm wide
..... *K. tibetica* MAXIM.
- 3a. Female flowers provided with a perianth of small scales falling off with the
2,5–3 mm long achene *K. sibirica* TURCZ.
- b. Female flowers without a perianth 4
- 4a. Achene 2,5–3 mm long; scales mostly oblong-ovate ... *K. Smirnovii* IVANOVA
- b. Achene 3,5–4 mm long; scales mostly triangular-ovate.....
..... *K. schoenoides* (C. A. MEYER) STEUDEL

Kobresia pamiroalaica apparently plays quite a part in the composition of pastures at high altitudes. STANIUKOVITCH has described from Eastern Pamir two types of wet association where this *Cyperaceae* is involved. In the first type, *Kobresia pamiroalaica* and *Carex pseudofoetida* are dominant, with *Poa tibetica*, *Potentilla multifida*, *Oxytropis hirsutusecula*, *Taraxacum ceratophorum*, *Primula sibirica* and *Kobresia stenocarpa*. At 4500 m of altitude, *Kobresia pamiroalaica* and *Potentilla pamiroalaica* are dominant, the other components of the association being *Kobresia stenocarpa*, *Carex melanantha*, *Smelowskia calycina*, *Carex pseudofoetida*, *Artemisia rupestris*, *Cerastium cerastioides*, *Primula sibirica* and *Roegneria schugnanica*. In both cases, *Kobresia pamiroalaica* occupies 60% of the space.

K. persica KUEKENTHAL (Syn. *Kobresia Royleana* (NEES) BOECK. var. *humilis* KUEKENTHAL, *K. humilis* SERGIANSKA). – C: Bamian: Koh-i Baba Kette, oberhalb des Sard-darra, 4000 m (G. 2900). Unai, 2900 m, Schneeboden (V. 1635).

K. pusilla IVANOVA, Journ. Bot. Russ. 24: 496 (1939). – Pakistan: Chitral: Turikho River, Istar, 10500 ft., on short turf (STAINT. 2496).

A tentative determination, the material being immature.

K. Royleana (NEES) BOECK. (excl. syn. *Kobresia stenocarpa* C. B. CLARKE p.p. et *Elyna stenocarpa* KAR. et KIR.). – E: Ghazni: Ad lacum Sabzab, inter Okak et Behzud (Diwal Kol), 2800 m (RECH. 17918). Inter jugum Kotal-e Ketschru et pagum Miradina, NW Sang-i Masha, 33°25'N, 66°45'E, 3200 m (RECH. 17543). Kabul (fide C. B. CLARKE). – C: Koh-i Baba, 3100 m (K. 2656). ***Kobresia sanguinea*** (BOOTT) RAYMOND, comb. nov.
(Syn. *Carex sanguinea* BOOTT, Trans. Linn. Soc. 20: 137 (1846). – E: ‘Afghanistan’ (GRIFF. 6094, 6111).

I did not see GRIFFITH’s gatherings, but there is a good set of specimens in the GRAY Herbarium (Cambridge, Mass., U.S.A.) collected by R. R. STEWART at Murree, the only Himalayan locality known. With its very long brick-coloured persistent stigmas, it is closely related to *Kobresia laxa* NEES and *K. afghanica* RAYMOND, and so aberrant in Subgenus *Indocarex*, that I have no hesitation to bring it into genus *Kobresia* and to create, in conformity with IVANOVA’s monograph, a new series to accommodate them.

K. stenocarpa (KAR. et KIR.) STEUDEL (Syn. *Elyna stenocarpa* KAR. et KIR., *E. kokanica* REGEL, *Carex paniculata* (non L.) REGEL, *Kobresia paniculata* MEINSH.,

K. Royleana KUEKENTHAL). – **NE: Nuristan:** Sanglich, 11500 ft., along spring (Kz. 12606). In jugo Mrami versus pagum Shтиве, 3000 m (Kn. 1412). – **C:** Sumpfwiese im Sard Darra in der Koh-i Baba, 3350 m (G. 289). Unai-Pass, zwischen Kabul und Bamian, 3120 m (G. 288).

K. tibetica MAXIM. (Syn. *K. Littledalei* C. B. CLARKE, *K. capillifolia* (DECNE.) C. B. CLARKE var. *tibetica* KUEKENTHAL, *K. schoenoides* (non STEUDEL) auct. p.p.). – **Pakistan: Chitral:** Khot An, N of Mastuj, between Turikho and Mastuj Rivers, on rock ledges, 13000 ft., in tufts (St. 2844).

 b. Perigynia 3–4 mm long. Spikelets 2–3 cm long, 0,5 cm wide *C. songorica* KAR. et KIR.

Carex alsia RAYMOND, spec. nov.

Sect. *Atratae* KUNTH Subsect. *Alpinae* KALELA – Rhizoma caespitosum, radicibus numerosis, intricatum, breve stoloniferum. Culmi numerosi, 40–45 cm alti, obsolete trigoni, striati, graciles sed rigidi. Folia basalia et subbasalia glaucoviridia culmis breviora, 15–20 cm longa, 2–3 mm lata, longe acuminata, apice margine spinulosa, basi vaginis cinnamomeis mox fibrillosis dense investa. Spiculae 3 sessiles, dense congestae (saepe quarta remotiuscula bracteata), 6–10 mm longae, ovatae, terminali androgyna, lateralibus femineis. Bracteae 6–20 mm longae, spinulosae, ore atratae, aut totae nigrescentes, haud vaginantes. Utriculi 2,5 mm longi, obovati, subinflato-trigoni, celuloso-reticulati, enerves, basi stipitati, in rostrum breve conicum oblique sectum atrum abrupte contracti. Squamae ovatae, atratae, acuminatae, clare carinatae, 2 mm longae. Nux subovata, trigona, stipitata, 1,75 mm longa, dense puncticulata, pallide flava. Basis styli aequalis persistens. Stigmata (3), 2 mm longa.

Pakistan: Chitral: Khotan, N of Mastuj, between Turikho and Mastuj Rivers, alt. 13000 ft., on rock ledges, anno 1958 (STAINTON 2839, Typus, W).

Another apparently good segregate of the '*C. alpina*' group, that seems to link the *Atratae* and the *Alpinae* and distinct from all its relatives in several minor characters. The whole group, well represented in Western North America and Central Asia, is in need of a serious revision. Examination of several types abroad shows for one thing that most species have been described on very poor material. Working the part of the *Cyperaceae* for Symbolae Afghanicae has given me the opportunity to write new descriptions of such neglected – but apparently perfectly recognizable species – as *C. trispiculata* BOECK. and *C. pseudobicolor* BOECK., to

mention only these two. During recent years, I had access to modern and perfectly mature material of several members of this essentially alpigenous group of species, with the hope of eventually revising the whole section.

Carex austro-afghanica RAYMOND, spec. nov.

Sect. *Arenariae* KUNTH – Affinis *C. accrescens* OHWI (Syn. *C. pallida* C. A. MEYER, non SALISB.). – Rhizoma deficiens, sed probabiliter repens. Culmi erecti gracillimi 25–30 cm alti, 1–1,25 mm diam., trigoni, angulis apicem versus scabriusculi. Folia subbasalia, pauca, culmo breviora, 15–25 cm longa, 2 mm lata, glaucescentia, longe vaginantia, vaginis pallide castaneis striatis mox fibrillosis. Spiculae 4–7 ovatae androgynae, 8–10 mm longae, contiguae spicam subcongestam globoso-elongatam 1,5–2,5 cm longam formantes. Bractea amplectens squamiformis scabroso-aristata, ad 7 mm longa. Utriculi squamas aequantes, ovati, 4 mm longi, plano convexi, enervii, vix alati, pallide castanei, basi stipitati, in rostrum ca. 1 mm longum bidentatum spinulosum ore hyalino contracti. Squamae ovatae castaneae acuminatae, carina spinulosa, margine hyalina. Nux fere totum utriculum explans 1 mm longa, quasi quadrata, basi stipitata, luteola, puncticulata, basi styli persistentis coronata.

N. Afghanistan, 6.5.1938 (MEINERTZHAGEN, Typus, BM).

A remarkable plant, yet known only from this gathering and lacking the underground parts, quite important in Subgenus *Vignea*. The slender habit suggests at first look *C. accrescens* OHWI, of Northern and Eastern Asia, but its leaves are narrower and its glabrous perigynia nerveless. The nearly quadrate achene is quite unusual.

C. cardiolepis NEES – NE: Nuristan: Gegenüber Aterschuker, NW-Hang, Horst im Buschwald, 2300 m (Kn. 1023). Zwischen Mum und Aspit im Kantiwo-Tal, im lichten Zedernwald, 2400 m (Kn. 901). Berg NNE von Kamdesch, 2700–2800 m (G. 334, 335). – E: Waziri, Zedernwald, 2400 m (V. 2533). Pakistan: Kurram Valley (AITCH. 418, 1244). ‘Afghanistan’ (GRIFF. 6072).

Carex chitralensis NELMES, Nytt Mag. f. Bot. 1: 22, fig. 10 (1952).

Cespitose, the freely stoloniferous horizontal rhizomes very slender, 1 mm in diam., and covered with reddish scales. Stems 15–25 cm long, erect or recurved, the base thickened by fibrous sheaths and reticulate fibrous remains of sheaths. Leaves subbasal, 1 mm wide, mostly shorter than the stems, recurved and circinate at tips, longly sheathing, the sheaths whitish. Spikes 2–3 (4), the lower one more or less distant; terminal one staminate, 1,25–2 cm long, 2–3 mm wide, cylindrical or subclavate; lateral ones pistillate, 7–14 mm long, 3–5 mm wide, densely flowered, more or less ovoid, the upper ones subsessile. Bract sheathing shorter than the inflorescence. Perigynia 4,5–5,25 mm long, 1–1,5 mm wide, elipsoid, trigonous, densely white-hispidulous, passing into a bidentate barely marginate beak marked on the back by a red patch. Scales 3,75–4,75 mm long, oblong-ovate, cymbiform, transparent, reddish with a wide hyaline margin. Achene 3 mm long, with a definite stipe and a definite beak of same length, 1,25 mm. Stigmas 3.

Pakistan: Chitral: Barum Gol, wet slope above Shokor Shal, E. side of Main Barum Glacier, c. 3600 m, 23.7.1950 (WENDELBO, Typus, OSLO, Isotypus MTJB). **Pakistan: Hazara Distr.:** Murree Hills, Dsunga Gali, steep slopes along pipe-line trail, c. 8000 ft., locally common in rock crevices (WEBSTER & NAZIR 5710, BM).

C. chitralensis NELMES var. *excedens* RAYMOND, var. nov.

Pergracilis, ad 50 cm alta, densissime caespitosa; spiculis masculinis saepe rotundatis; ceterum ut in var. *typica*.

Pakistan: Chitral: Shah Jinali Pass, N of Mastuj, 14000 ft., on dry stony rock, 1.8.1958 (STAINTON 3043, Typus, BM). Ziarat, Lowarai Pass, 7000 ft., in tufts on rock ledges (STAINTON 2321). Birir, 35°38'N, 71°44'E, dry cliff facing east, abundant at 10000 ft. (BOWES LYON 681, BM). Birir, crevices northern slope, 8500 ft. (BOWES LYON 694, BM).

An interesting species related to *C. cardiolepis* NEES, of a very limited range: Chitral and NW Pakistan, a frequent distributional pattern in the Himalayan flora.

— E: Sarobi, Quellsumpf (V. 2604). — Pakistan: Shinnak, Kurram Valley (ARTCH. 33).

Carex Gilesii NELMES, Kew Bull. 1939: 306 (1939).

Stoloniferous. Stem 50–65 cm long, triquetrous, leafy at base only, smooth, surrounded by a few leafless sheaths. Sterile leaves bunched 4–7 mm wide, much shorter than the stem, longly attenuate, mostly flat. Spikes 4, the 2 superior ones male, 1,5–2 cm long, the 2 others female, 2,5–3,5 cm long, 5 mm wide, all peduncled, the basal one much more so, the 3 others more or less fastigiate, cylindrical, densiflorous, more laxely flowered at the base, nodding. Inferior bract briefly foliaceous, shorter than the spikes, longly sheathing, the upper ones much reduced. Perigynia 4 mm long, 2 mm wide, elliptic-obovate, papyraceous, whitish at the base and tinged with purple at the tip, compressed, nerveless, passing rapidly to a short whitish slightly bilobed, flexuous, smooth beak. Scales narrowly oblong, 3,5–4 mm long, acuminate, brown purple, the pale midrib excurrent. Achenes stipitate, occupying the lower part of the perigynia. Stigmas 3 more or less included.

Pakistan: Chitral: Oihor Gol, 36°04'N, 71°48'E, in running water, 11000 ft. (BOWES LYON 821). Golen (Krui Uts), 36°01'N, 72°10'E, 13500 ft., moist soil among large boulders (BOWES LYON 131). Carex infuscata NEES (Syn. *C. alpina* SW. var. *infuscata* (NEES) BOOTT p.p., *C. alpina* SW. var. *infuscata* (NEES) KUEKENTHAL p.p., excl. syn. *C. trispiculata* BOECK.), descr. emend.

In dense tufts, the intricate freely forking rhizomes covered with fibrous remains of old sheaths. Stems 30–45 cm high, slender, sharply trigonous, sheathing, the base thickened by accumulated old drab fibrillose sheaths. Leaves basal, much shorter than the stems, glaucous-green, 2–3 mm wide, long acuminate, finely setulose at tip. Spikes 2–3 approximate (or 4 with the lowest one remote), sessile, the terminal one 6–7 mm long, androgynous, the lateral ones slightly smaller, female. Bracts much longer than the spikes, barely sheathing, spinulose, blackish at mouth. Perigynia 3 mm long, ovate, tumid-trigonous, pale yellow, finely cellulose-reticulate, slightly stipitate, the stipe dark red, the two lateral nerves well marked, the others faintly so in the lower half, ending into a conical slightly bidentate, black-girdled beak. Scales

ovate, dark red, the mid-vein paler and spinulose, much shorter than the perigynia. Achene 2 mm long, sharply trigonous, pale yellow, the base of the style persistent. Stigmas 3, slender, exserted.

NE: Nuristan: Im Kantiwo-Tal zwischen den Dörfern Kantiwo und Brubruts, 2200–2460 m (KERSTAN 932). Im Kantiwo-Tal oberhalb Brubruts, 2460 m (KERSTAN 948). Drudo Pass, zwischen Aschkun und Petsch-Tal, 3280 m (KERSTAN 1237-c). Im Kulam-Tal beim Dorf Kulam (Munui), 2200 m, auf nassem Schutt (KERSTAN 1055). Shabul Gul (KITAMURA 40, 46). – **E:** Kabul: Paghman Tal, am Ufer des Paghman-Flusses, 2540 m (GILLI 329). In den Bergen von Paghman oberhalb Beg-tut, 2900 m (GILLI 331). In Schluchten östlich des Nedschrab-Flusses gegen Schechan, 3100–3200 m (GILLI 330, 332). – **Pakistan: Chitral:** Chumarkhan Pass, E of Mastuj, on marshy ground, 13000 ft. (STAINTON 2921).

C. Karoi FREYN – **NE: Nuristan:** Sanglich, Minjan Pass, 3800 m (Kz. 12610). – **Pakistan; Chitral:** Tirich Gol, 36°25'N, 72°15'E, shady soil beneath willows, 11000 ft. (B. L. 1068).

C. maritima GUNNER. (Syn. *C. incurva* LIGHTF.). – **E:** ‘Afghanistan’ (GRIFF. 89).

C. melanantha C. A. MEYER – **NE: Nuristan:** Minjan Pass, 12000 ft. (Kz. 12662). – **Pakistan: Chitral:** Baroghil Pass, 12500 ft., at edge of marsh (St. 2970).

In addition to *C. melanantha* itself, I have been able, recently, to examine mature material of *Carex paeclarata* NELMES, *C. Moorcroftii* FALC., *C. sabulosa* TURCZ. and *C. leiophylla* MACKENZIE, closely-related, mostly sand-binding, species inhabiting high plateaux of Central Asia, except the last one which has been described from Yukon.

Carex paeclarata NELMES, of Tibet, with its large scales, stands apart. KUEKENTHAL treated *C. Moorcroftii* and *C. sabulosa* as varieties of *C. melanantha*. On the other hand, KREJCZETOWICZ, who wrote the treatment of *Carex* for the Flora URSS and who, following the Komarovian school, raised most geographical variants of wide-ranging species to specific rank, recognized *C. melanantha* C. A. MEYER, a closely-related segregate, *C. melanthaformis* LITW., but wrongly considers *C. Moorcroftii* FALC. a synonym of *sabulosa* TURCZ. of a much wider range. The three were placed by him in a cycle *Orthocranion*, a subsectional category, the description of which is written in Russian.

Mr. J. A. CALDER, Ottawa, has provided me, a few years ago, with a good sheet of *Carex leiophylla* MACK. collected at Carcross, the type-locality, covering large tracts of sand, as well as a photograph of the type (NY). The conclusion of my examination is that *C. paeclarata*, *C. melanantha*, *C. Moorcroftii* and *C. sabulosa* are distinct species, but that *C. leiophylla* is identical with *C. sabulosa*.

It is of great phytogeographical interest, that the more we know about the flora of Alaska and Western Canada, the more we find species with a more or less wide area in Asia, transgressing into Western Canada. Outside of *C. sabulosa* TURCZ. (Syn. *C. leiophylla* MACK.), I may add some other examples taken amongst the Cyperaceae: *Carex Franklinii* BOOTT (Syn. *C. macrogyna* TURCZ., *C. misandroides* FERN.), *C. eleusinoides* TURCZ. (Syn. *C. kokrinensis* A. E. PORSILD) and *Kobresia sibirica* TURCZ. (Syn. *K. hyperborea* A. E. PORSILD). This floristic pattern in our northern flora seems to me more frequent than first suspected.

Several other species of section *Atratae* need revaluation. Essentially alpine species, they are found growing as high as 18000 ft. of alt. in Central Asia. In contrast with Europe, where few species are known to occur, Asia and Western North America harbor a host of them, 30 species alone in America and as many in Asia. Most of these are ‘good’ species but the problem

with them is that the type is usually poor, either too young or too old, and actual collections are often not better, not mentioning that in herbaria they are, as a rule, wrongly determined.

C. microglochin WAHLENB. – **NE:** Nuristan: Minjan Pass, 12000 ft., in meadow (Kz. 12676).

C. nivalis BOOTT – **NE:** Nuristan: Mranu Pass gegen Shtive, 2000 m (Kn. 14080). – **E:** Kabul: Paghman-Berge, N von Kotal-e Kotandar, 4300 m (G. 336). Kalai Surkh (N. 1950/662). Kabul, 7000 ft., swamp (M.). – **C:** Unai Pass, 2800 m (V. 1656). Bulola, 2200 m (RECH. 16738). Kamard-Tal, W von Doab, 1620 m (G. 326). Am See Band-i Gholaman, Band-i Amir, 2800 m (RECH. 18475). See-Ufer von Band-i Amir, 2800 m (G. 324, 328, RECH. 18300, 18301, V. 2828). Am oberen See von Band-i Amir (N. 1950/476). Sard Darra, Koh-i Baba, 3350 m (G. 325). Montes Koh- Baba, in latere austro-orientali jugi Hadjigak, 3000 m (RECH. 18527). Koh-i Baba, 3100 m (K. 2669). – **Pakistan:** (GRIFF. 6105). Kurram Valley, 10000 ft. (AITCH. 501). Chitral: Rumbur, 35°46'N, 71°40'E, peaty boggy portion in stream, 9500 ft. (B. L. 668, 670). Partsan, 63°03'N, 71°52'E, wet bank facing south in rich soil, 9700 ft. (B. L. 844). Ojhor, 36°04'N, 71°48'E, damp alpine pasture, steep slope, 12000 ft. (B. L. 864). Mastuj, 7500 ft., in marsh (St. 2482). Agram, Arkari Gol, W of Tirich Mir, 10500 ft., on damp ground (St. 2643).

C. orbicularis BOOTT var. *bulungensis* OSTENFELD – **NW:** Obeh, 1700 m (K. 3724). – **C:** Hauz-i Mahiha (K. 2406). Farakulum, 2800 m (K. 2605).

In Central Asia, *Carex orbicularis* BOOTT is vegetatively as variable as *C. Bigelowii* TORR. of the arctic zone. In loose soil, the rhizomes are not so tufted and the stolons get longer. Var. *bulugensis* OSTENFELD is a useful name for such specimens reaching 60 cm in length, with wider leaves and bigger spikes.

C. oxyleuca V. KREcz. (Syn. *C. ustulata* (non SCHKUHR) auct. fl. turkest. – ‘Afghanistan’ (sive Fl. URSS. 3: 284 (1935).).

C. pamirensis C. B. CLARKE (Syn. *C. vesicaria* L. var. *pamirica* O. FEDTSCH., *C. pamirica* (O. FEDTSCH.) B. FEDTSCH., *C. vesicaria* L. var. *alpigena* (non FRIES) B. FEDTSCH., *C. ampullacea* (non GOOD.) DUTHIE, *C. rostrata* (non STOKES) O. FEDTSCH., *C. obscuriceps* KUEKENTHAL var. *pamirica* (O. FEDTSCH.) KUEKENTHAL). – NE: Nuristan: Oberes Kantiwo-Tal oberhalb Brubruts, auf Sumpfwiesen an einem Bach, 2600 m (Kn. 957). ‘Afghanistan’ (sive Fl. URSS. 3: 448 (1935). – Pakistan: Chitral: Barogil Pass, 13000 ft., at edge of lake (St. 2994).

C. parva NEES (Syn. *Kobresia Lolonum* HAND.-MZT.). – C: Bamian: Sard Darra, Koh-i Baba Kette, 3350 m (G. 296). Koh-i Baba, 3100 m (K. 2657).

C. philocrena V. KREcz. in Fl. URSS. 3: 393 (1935). (Syn. *C. Oederi* (non RETZ.) auct. var. *philocrena* KOYAMA in KITAMURA, Fl. Afgh. 51 (1960).) – NE: Nuristan: Between Chatrass and Kushimaikot (KITAMURA 38). – E: Im Panjshir-Tal bei Gulbahar, 1700 m (G. 341-b, V. 250 p.p.). Paghman-Tal bei Kabul, 2300–2800 m (RECH. 17193). Paghman, 7500 ft., wet meadow (Kz. 12106). – C: Kamard, NW Doab, 2000 m (Kz. 13605). Doab, 1400 m (K. 2883). – Pakistan: Swat: Utror, 2500 m (RECH. 19563).

A well-marked species related to *C. demissa* HORREM. (“*C. Oederi*” auct., non RETZ.) with golden-yellow perigynias gathered in 4–6 spikelets, the lowermost remote, subtended by a bract 3–4 times longer than the inflorescence.

C. physodes M. B. – NW: Hari-rud Valley (AITCH. 1134). – SW: Herat, 1100 m (K. 3541). – E: ‘Afghanistan’ (GRIFF. 6083).

A typical steppe-plant, well adapted to dry conditions, the numerous minute rootlets covering large tracks of sand (map of distribution in Sov. Bot. 4: 49 (1937).). The enlarged fleshy perigynia are quite unique in the genus *Carex*. The plant is an important fodder for Kara-Kum sheeps in the Kara-Kum region. See KACHKAROV & KOROVINE. La vie dans les déserts, éd. française par Théodore Monod (PAYOT, Paris, 1942).

C. plectobasis V. KREcz. (Syn. *C. hirtella* DREJER (1844), non F. S. GMEL. (1791). – Pakistan: Kurram Valley, 11000 ft. (AITCH. 724, 1007).

C. polyphylla KAR. et KIR. (Syn. *C. nemorosa* LUMN., non SCHRANK, *C. Leersii* F. SCHULTZ, *C. Pairaei* F. SCHULTZ var. *Leersii* (F. SCHULTZ) KUEKENTHAL, *C. echinata* MURR. var. *Leersii* (F. SCHULTZ) KUEKENTHAL, *C. muricata* auct. plur., non L.). – Pakistan: Kurram Valley (AITCH. 670).

Carex pseudobicolor BOECK. (Syn. *C. alpina* SW. var. *erostrata* BOOTT, *C. alpina* SW. ssp. *infuscata* (NEES) KUEKENTHAL var. *erostrata* (BOOTT) KUEKENTHAL), descr. emend.

In dense tufts; the intricate forking rhizomes covered with fibrous remains of sheaths. Stems 8–12 cm long, filiform, acutely trigonous, scabrous, nodding at tip. Leaves basal, 1–2 mm wide, yellowish-green, the margins scabrous, long acuminate, about half the size of the stems. Spikes 3, approximate, sessile, the central one a little longer, androgynous, the two others female, all densely flowered. Bracts narrow, about equalling the inflorescence, shortly sheathing, the mouth of the sheath blackish. Perigynia 2,2 mm long, obovate, tumid-trigonous, yellow-brick coloured, nerveless, finely cellulose-reticulate, obtuse and beakless, the mouth black-girdled, Scales black, the mid-nerve spinulose, about equalling the perigynium. Achene 1,25 mm long, largely ovate, trigonous, very finely puncticulate, the angles thickened and crowned by the persistent style-base. Stigmas 3, barely exserted.

Pakistan: Chitral: Och Anzog, 3600 m, 19.7.1950 (WENDELBO).

C. pseudofoetida KUEKENTHAL – **E:** Kabul: Paghman, 17 miles W Kabul, 8000–9000 ft. (CH.-M.). Kabul (KITAMURA 29, 35). – **C:** Bamian: Shibar Pass (KITAMURA 44). Sard Darra, Koh-i Baba, 3350–4350 m (G. 316, 317, 318). – **Pakistan:** Quetta (KITAMURA 55). Chitral: Lashpur (Ishporill), 26°02'N, 72°27'E, 13600 ft., rich pasture near edge of stream (B. L. 105).

A well-marked species, the Centro-Asiatic representative of *C. foetida* ALL., of the European Alps, and of *C. vernacula* BAILEY, of the Rocky Mountains of North America, an interesting case of parallel evolution.

C. psychrophila NEES – **Pakistan:** Chitral: Shishi Gol, E of Drosch, 7000 ft., on marshy ground (St. 2378).

C. pycnostachya KAR. et KIR. – **NW:** Qala Nau, 900 m (K. 3693). – **E:** Darul-fanun bei Kabul (N. 1951/22). Kabul (V. 69-b, 827, 834). – **C:** Panjao, 2800 m (K. 2744).

It is very difficult to deal with the various biotypes that occur in the *Carex stenophylla* complex. Some of them are apparently quite clear-cut in their extremes, if you do not examine too many specimens of them.

KUEKENTHAL's treatment is too conservative and a little incoherent in a way, though in later years he had another view on the subject. In 1909, he had in his monograph *C. stenophylla* itself with f. *elata* (SCHUR) KUEKENTHAL and f. *pachystylis* (GAY) ASCHERS. et GRAEBN., and the following varieties: var. *duriusecula* (C. A. MEYER) TRAUTV., var. *exigua* (SCHUR) KUEKENTHAL, var. *longepedicellata* (BOECK.) KUEKENTHAL, var. *enervis* (C. A. MEYER) KUEKENTHAL and var. *desertorum* LITWINOW.

In 1930, studying SMITH's Chinese gatherings of sedges, KUEKENTHAL found out that he made a mistake in associating *C. enervis* with *C. stenophylla*: "In meiner Monographie der *Caricoideae* (1909), p. 122, habe ich *C. enervis* C. A. MEYER als Varietät *C. stenophylla* WAHLENB. untergeordnet. Das zahlreiche Material, welches ich seitdem gesehen habe, führt mich zu der Ansicht, das die dort angegebenen Merkmale so konstant und so wesentlich sind, dass sie zur artlichen Trennung drängen". (Acta Horti Gothoburg. 5: 41 (1930).).

In fact, *C. enervis* C. A. MEYER, of which I have examined authentic specimens from Yunnan, Baical and Jacuts, is not related to *C. stenophylla*, but to *C. maritima* GUNN. (Syn. *C. incurva* LIGHTF.).

The North American representative had a poor treatment from the start. It was described as *C. Eleocharis* by BAILEY in 1889, but without any relationship indicated to *C. stenophylla*, instead it was said to be related to *C. disperma*. The type (immature), MACOUN 1665, from Saskatchewan, KUEKENTHAL did not see. In his monograph, he placed *C. Eleocharis* in the same section as *C. disperma*, adapted BAILEY's description to fit his own style, cited MACOUN's specimen with the n.v. that indicated his entire reliance on BAILEY. At the same time, he placed all the North American specimens that he had seen under *C. stenophylla* itself. In the new edition of GRAY's Manual (1950) FERNALD, unaware of KUEKENTHAL's second thought on the matter, treated the North American phase as *C. stenophylla* WAHLENB. var. *enervis* (C. A. MEYER) KUEKENTHAL. In 1931, MACKENZIE had used *C. Eleocharis* BAILEY for the North American plant and had pointed out its relationship with, and its distinction from, typical Eurasian *C. stenophylla* WAHLENB.

In 1908, *C. uralensis* C. B. CLARKE was published posthumously, too late to be taken into account by KUEKENTHAL, whose work was already in the printer's hands. C. B. CLARKE was restricting *C. stenophylla* to Europe.

In 1910, LITWINOW had some problems classifying his material from Turkestan and two useful segregates were set out: var. *pellucida* and var. *interrupta*, with reference to a former var. *desertorum*. One finds there a good understanding of the behaviour of the species in the desertic regions of Central Asia.

As early as 1884, FRANCHET had set apart the Far East representative as var. *rigescens*. Examination of various collections, including DAVID's, BUNGE's, FAURIE's, show that, with its hyaline scales and general shape of the aggregated spikes, it is the clearest cut of all the segregates. KUEKENTHAL wrongly placed var. *rigescens* in the synonymy of f. *pachystylis*. *C. pachystylis* GAY is based on flowering material; GAY states that it is remarkable by its thickened style-base. In a group as difficult as the *Vigneae*, I would reject this name entirely, though ASCHERSON and GRAEBNER retained it at formal rank for the European specimens (presumably shade-forms) with wide leaves (not BOISSIER's var. *planifolia*) and in the Flora URSS., it is treated as a species in another section, i.e. the Physodeae, with the well-known *C. physodes* M.B., characterized by big inflated reddish perigynia, with which it apparently hybridizes. To my mind, *C. pachystylis*, at least sensu KREZETOWICZ, is *C. physodes* with sterile, undeveloped female flowers. The underparts with their innumerable minute rootlets are unmistakable.

The late KRECZETOWICZ wrote the treatment of *Carex* for the monumental Flora URSS. under the editorship of KOMAROV. As everyone knows, the KOMAROVIAN school treats as species every geographical variant, in contrast with the MAXIMOWICZ era, where a sense of synthesis always presided over the setting out of new taxa. So, there is no surprise that in this work *C. stenophylla* itself is not treated, being restricted to Eastern non-Russian Europe. It is replaced by *C. uralensis* C. B. CLARKE. Then *C. stenophylloides*, *C. duriusculiformis*, *C. rigescens* are described. *C. duriuscula*, *C. pachystylis* (in another section) are retained as species. Between this extreme view and KUEKENTHAL's there is an immense gap. Trying to conciliate the two, correcting the first, specially in regard to synonymy, and trying to take the best of the second, I propose here a realignment of the segregates of *Carex stenophylla*.

Pending further investigations, not only in herbaria but in the field, I do not think that any of the so-called species described by V. KRECZETOWICZ can be treated as such, neither as subspecies. At best they can be kept as varieties; though I have no experience with them in the field, they look, as a whole, as accommodates, i.e. seasonal ecotypes. In dry seasons or in dry areas, some plants will have a very short vegetative life, belonging to the ephemeroid type; in better conditions they will grow during all summer. In the first case, the rootstock will become more or less pseudobulbous, through thickening, whereas a luxuriant foliage will develop in the other case, even flat leaves. Examination of a good number of specimens from North America shows that they duplicate several of the variations of the Asiatic population. The adventage of the present grouping is that the names of all the varieties are available as such, so that no transfers are needed. In a difficult group, it is not wise to set up new names; it only adds confusion to chaos.

Dr. TYCHO NORLINDH has recently studied carefully the European population (the type comes from Austria) and concluded that *C. uralensis* C. B. CLARKE is morphologically indistinguishable from *C. stenophylla* WAHLENB., their variation amplitude overlapping greatly. This was a first step towards a better understanding of the Mongolian population. Dr. NORLINDH's later opinion may alter the present synopsis:

Carex stenophylla WAHLENB., Vet. Akad. Handl. Stockh. 24: 124 (1803); KUEKENTHAL, Cyper.-Car. 120 (1909), pr. pte. max.; NORLINDH, Bot. Not. 113 (1): 1–19, fig. 1–5 (1960). C. subphysodes M. POPOV ex V. KREJCZ., Act. Univ. As. Med. Bot. 20: 23 (1935).

E: Kabul, an einem trockenen Feldrain bei Kabul-Gulbagh (N. 1951/24).

Apparently an hybrid between *C. physodes* and *C. stenophylla* var. *planifolia* or, perhaps, a specimen of *C. physodes* with undeveloped utricles.

C. subvulpina P. SENAY, Bull. Mus. Paris, 2e série, 17 (5): 444 (1945). (Syn. *C. compacta* (non LAM.) V. KREJCZ., *C. nemorosa* REBENT., *C. vulpina* (non L.) KUEKENTHAL, *C. vulpina* L. var. *nemorosa* KOCH, *C. vulpina* L. var. *tenuior* TREV., *C. vulpinoidea* (non MICHX.) BOISS., *C. vulpina* L. var. *pallidior* MEINSH., *C. vulpina* L. var. *orientalis* PACZ.). – ‘Afghanistan’ (AITCH. 870).

KRECZETOWICZ was the first to notice that two taxa were involved in *C. vulpina* L. He revived *C. compacta* LAM. (1778) for the second species, but, as the late P. SENAY has demonstrated, in a minutious study of the group (Le *Carex vulpina* et ses alliés, Bull. du Muséum, 1945), LAMARK's diagnosis applies only to *C. vulpina* s. str.

Carex trispiculata BOECK., Cyper. nov. 1: 45 (1888). (Syn. *C. alpina* (non Sw.) AITCH., *C. Vahlii* (non SCHKUHR) BOISS., *C. alpina* Sw. ssp. *infuscata* KUEKENTHAL, Cyper.-Car. 386 (1909), pr. pte., quoad spec. AITCHISON, *C. alpina* Sw. ssp. *infuscata* (NEES) KUEKENTHAL var. *humilis* GILLI, FEDDES Repert. spec. nov. 64: 217 (1962), descr. emend.

In dense tufts, the intricate freely forking rhizomes covered with fibrous remains of old sheaths. Stem 3–12 (–25) cm long, slender and stiff, sharply trigonous, the base thickened by accumulated old sheaths. Leaves basal, much shorter than the stems, 3–5 cm long, 1 mm wide, long acuminate, often falcate and involute, the margin finely spinulose. Spikes 2–3, approximate, sessile, the terminal one 4–5 mm long, androgynous, the lateral ones female, a little shorter and wider. Bracts about equaling the spikes, barely sheathing, spinulose, the mouth black. Perigynia 2,75 mm long, ovate, tumid-trigonous, pale yellow, finely cellulose-reticulate, the two lateral nerves well marked, the others faintly so, ending in a conical slightly bidentate, black girdled beak. Scales dark, red, the mid-vein paler, slightly shorter than the perigynia. Achene 2 mm long, sharply trigonous, rhomboidal, the base-style persistent. Stigmas 3, very slender, exserted.

Zwischen Tschardeh und dem Logar-Tal, ca. 1840 m, Matte in einer Schlucht (G. 431). Zwischen Tang-i Saidan und Lallandar, ca. 1810 m (G. 430). Panjshir: In der Panjshir-Schlucht bei Gulbahar, nächst Charikar, ca. 1700 m (G. 429). – C: Hauz-i Mahiha, ca. 2500 m (K. 2487). Hauz-i Mahiha, ca. 2800 m, in rivulo lente fluente (RECH. 18550). Im Kamard-Tal, am rechten Ufer des Surch, westlich von Doab, ca. 1620 m (G. 423). – NE: Kataghan: In valle fluvii Kunduz inter Doshi et Doab, 800–1300 m (RECH. 16589). In paludosis fluvii Kunduz, ca. 400 m (RECH. 16048). Nuristan: Gusalak, ca. 1000 m (E. 1584). – Pakistan: Chitral: Shoghot, N of Chitral, ca. 6000 ft., on marshy ground (St. 2746).

Pooideae-Aristideae

Aristida L.

A. adscensionis L. – E: Unterhalb des Dorfes Nurgel im unteren Kunar-Tal, zwischen Tshagan-Serai und Jallalabad, 600–800 m, Gneiss-Schiefer (KN. 666). Bei Wama im oberen Petsch-Tal, ca. 1380 m, Eichenwald (KN. 1284-a). – NE: Nuristan: Gusalak, im Kurder-Tal, Seitental des Petsch-Tales (N. 1951/836). Darim-Tal ab Ort Darim aufwärts, 1900–2400 m (N. 1951/1006). – Pakistan: Dir.: Distr.: Panj-

kora-Tal bei Warai, ca. 1000 m (Kn. 2106, 2112). Warai, ca. 1200 m (Kn. 2117-a). **Quetta:** Near Quetta, ca. 1100 m (K. 3059).

A. ciliata DESF. in SCHRAD. – **E:** Jallalabad (V. 2050). Zwischen Nimla und Jallalabad, ca. 600 m (Kn. 630). Nimla, an der Strasse Kabul nach Jallalabad, auf Felsschotter (SCH. 75).

A. cyanantha NEES ex STEUD. – **E:** Kabul: In glareosis supra Sarobi, ca. 1000 m, ab urbe Kabul orientem versus (RECH. 19347). Im Nedschrab-Tal oberhalb Schechan, zwischen Gulbahar und Sarobi, ca. 2600 m (G. 397). Gulbahar bei Charikar (V. 1020). Oestlich von Istalif, zwischen Kabul und Charikar, Strassenböschung, ca. 1900 m (G. 396). Südhang des Aliabader Berges bei Kabul, ca. 1860 m, in einer Schlucht (G. 395). – **C:** Ghorband, WNW of Kabul (E. 2910). – **NE:** Nuristan: Asmar Barikot, ca. 900 m (E. 1611, 1614). Unteres Petsch-Tal bei Sinsi, oberhalb Retschalam, ca. 960 m (Kn. 698). Aschkun-Gebiet: Im Kotagel-Tal bei Kulatan, ca. 1500 m (Kn. 1223-a). Im Tal und um den Ort Kurder, Seitental des Petsch-Tales, 1600–1700 m (N. 1951/757). – **Pakistan:** Peshawar: In collibus supra Dargai, ca. 400 m (RECH. 19627). Chitral: Shishi Gol, NE of Drosh, ca. 6000 ft., at edge of fields (ST. 3149).

A. Griffithii HENR. – **E:** Kabul: Kabul, ca. 1700 m (K. 4006).

A. pennata TRIN. – **N:** Kataghan: Kunduz, zwischen Hazrat-e Eman und Kunduz (N. 1949/33). Sanddünen bei Karum Kul, nächst Ankhoi (N. 1950/208, 210). Zwischen Ankhoi und Schebergan, auf Sanddünen (N. 1950/211). – **NW:** Maymana: In arenosis mobilibus ad margines deserti Kara-Kum ca. 15–20 km ab Andkhui austro-occidentem versus, ca. 300 m (RECH. 16129). Halfway between Maymana and Andkhui, ca. 400 m, on sand dunes (HDG. & WDB. 3837).

A. plumosa L. – **SE:** Kandahar: Pirzada, near Kandahar, ca. 900 m (K. 2099). – **E:** Inter Jallalabad et Torkhan, in deserto arenoso, ca. 700 m (RECH. 19357). Jallalabad, Gneishügel (V. 2049). Zwischen Sarobi und Darunta, östlich von Kabul, Steppe (V.). Sarobi (V. 2575). Tang-e Gharu, near Kabul, ca. 1600 m (HDG. & WDB. 5104). – **NE:** Kataghan: Zwischen Kunduz und Hazrat-e Emen (N. 1949/34).

A. pogonoptila (JAUB. et SPACH) BOISS. – **E:** Jallalabad, östlich von Kabul, Gneiss-Hügel (V. 2049). Zwischen Sarobi und Darunta, in der Steppe (V. 1966).

A. Raddiana SAVI – **SE:** Kandahar: In der Schlucht bei Germaub, nördlich von Ghirishk, auf Konglomerat (Kn. 413).

Pooideae-Arundineae

Arundo L.

A. Donax L. – **SE:** Kandahar: Kajkai, N of Kandahar, ca. 1000 m (K. 2171). – **E:** Kabul: Schlucht Tang-e Gharu, östlich von Kabul, Schutthalde am Ufer des Kabul-Flusses, ca. 1650 m (G. 497). – **C:** Zwischen Doab und Schibar-Pass, am Fluss (N. 1950/224).

Phragmites TRIN.

Ph. communis TRIN. – **N:** Mazar-i Sharif: Südlich von Tashkurghan, am Fluss und als Unkraut in einem Baumwollfeld (N. 1950/214, 225). – **SW:** Herat: Cheshma

Obeh, ca. 1800 m, substr. granit. (RECH. 19244). Seistan, ca. 550 m (K. 3463). – **E:** Kabul: In fauibus Tang-e Gharru, inter Kabul et Sarobi, 1100–1300 m, substr. conglom. (RECH. 16958). In der Salzsteppe zwischen Kabul und Tang-e Gharru, ca. 1770 m (G. 492). Zwischen Kartetschar und Aliabad, auf einer Weidewiese, ca. 1780 m (G. 493). Am Ufer des Logar-Flusses bei Tscharasiah, südlich von Kabul, ca. 1780 m (G. 494). Pandscheschah bei Kabul, Schilfsumpf (N. 1950/37). – **C:** Am Ufer des Schumbol-Flusses bei Bulola, ca. 2280 m, Wiese (G. 495). Am Ufer des Bamian-Flusses bei Schar-e Schak, ca. 2320 m (G. 496). – **NE:** Panjshir: In der Panjshir-Schlucht bei Gulbahar, nächst Charikar, ca. 1700 m (G. 491). Badakhshan: Faizabad, bord de rivière (L.). – **Pakistan:** Chitral: Im Yarkhun-Tal bei Mastuj, 2040–2280 m, nasse Wiesen, *Hippophaë-Rosa*-Hecken (Kn. 2044, 2045). Brumboret, SW of Chitral, ca. 9000 ft., damp meadow (St. 3217).

Pooideae-Aveneae

***Avena* L.**

A. barbata POTT. ex LINK in SCHRAD. – **E:** Schlucht Tang-e Gharru, östlich von Kabul, 1600–1700 m, sehr steinig (Sch. 59-a).

A. fatua L. – **SE:** Kandahar: Tshil-sina (Sch. 20). – **E:** Sarobi (V. 2591). – **C:** Farakulum, ca. 2700 m (K. 2522). Doab, feuchter Acker (V. 2098). In der Panjshir-Schlucht bei Gulbahar, nächst Charikar, ca. 1700 m, felsiger Hang (G. 463-a). – **NE:** Badakhshan: Ishkamish, östlich von Jurm, Löss-Steppe (V. 2655). Jurm, ca. 1500 m (E. 2088). Qazi Deh (L. 1106). – **Pakistan:** Chitral: Yabur (Sch. 169). Tirich-Mir-Gebiet: Im Ojhor-Tal bei Tsusum, ca. 2800 m (Kn. F-134).

A. fatua L. var. *glabrata* PETERM. – **E:** Ghazni: Ad lacum Sabzab, inter Okak et Behzud (Diwal Kol), ca. 2800 m (RECH. 17949).

A. ludoviciana DUR. – **Pakistan:** Chitral: Arandu, SW of Drosh, ca. 4000 ft., a weed in fields of barley (St. 2291).

A. Wiestii STEUD. – **NW:** Khwaja, NE of Herat, ca. 700 m (K. 3793). – **SE:** Kandahar: Nordlich von Ghirishk am Hilmend (Kn. 409). Kajkai, NNW of Kandahar, ca. 1000 m (K. 3038). Tshil-sina bei Kandahar (Sch. 20). – **NE:** Nuristan: Gusalak, ca. 1000 m (E. 1545).

***Deschampsia* P. BEAUV.**

D. caespitosa (L.) P. BEAUV. – **Pakistan:** Chitral: Baroghil Pass, ca. 12500 ft., at edge of stream (St. 2998).

D. koelerioides REGEL – **NE:** Minjan, above Weran, ca. 3600 m (E. 1264). – **Pakistan:** Chitral: Agram, Arkari Gol, W of Tirich Mir, ca. 10500 ft., at edge of stream (St. 2642). Dorah Pass, Lutko valley, NW of Chitral, ca. 13500 ft., at edge of stream (St. 3247).

***Hierochloe* R. BR.**

H. laxa R. BR. ex HOOK. – **NE:** Nuristan: Pashki to Atsni Pass, ca. 2800 m (E. 705).

H. odorata (L.) WAHLENB. – NE: Nuristan: Westseite des Donda-Passes (Sch. 141). Porande-Pass, zwischen Aschkun-Gebiet und Petsch-Tal, ca. 3280 m (Kn. 1237).

Koeleria PERS.

K. cristata (L.) PERS. (Syn. *K. gracilis* PERS.). – E: Ghazni: In faucibus Say Khoshkak (Nawar Kotal), inter Okak et Behzud (Diwal Kol), ca. 3150 m, in saxosis calcareis (RECH. 17847, 17848). Panjshir valley, westside of Anjuman-Pass, ca. 3700 m, on dry slopes (Hdg. & Wdb. 5490). – C: Bamian: Kotal-i Reg, ca. 3400 m (K. 3067). – NE: Kataghan: Passhöhe Rabatak, zwischen Haibak und Pul-i Khomri (N. 1950/222). Nuristan: Pashki, ca. 2300 m (E. 905). Shtive, ca. 2800 m (E. 1035). Westseite des Semenek-Passes, ca. 3400 m, flache, steinige Matten der untersten Steilstufe (Kn. 1503). Pitwei-Tal, zwischen Pirdum-Pass und Kulam (Munui), 2200–2900 m, Grashang (Kn. 1080). Mum-Pass, zwischen Parun- und Kantiwo-Fluss, Aufstieg von Gulnischcha aus, 2500–2800 m (Kn. 874-a). Dondo-Pass, Aschkun-Gebiet, 2500–3200 m, Matten (Kn. 1251-a). Westseite des Semenek-Passes, ca. 3400 m, flache, steinige Matten der untersten Steilstufe (Kn. 1508). – Pakistan: Chitral: Rosh Gol, NE of Tirich Mir, ca. 9000 ft., on stony ground (St. 2809). Chumarkan Pass, E of Mastuj, ca. 12000 ft., on dry open slopes (St. 2900). Rosh Gol, NE of Tirich-Mir, ca. 10000 ft., on stony ground (St. 2805). Baroghil Pass, ca. 12500 ft., on open slopes (St. 2985).

Sphenopus TRIN.

S. divaricatus (GOUAN) REICHENB. – SE: Kandahar: Von Kandahar in Richtung Kalat-i Ghilzai, ca. 1100 m (Kn. 224).

Lophochloa REICHENB.

L. phleoides (VILL.) REICHENB. (Syn. *Festuca phleoides* VILL., *Koeleria phleoides* (VILL.) PERS.). – N: Mazar-i Sharif: Tacht-e Rustam prope Haibak, ca. 1200 m, in collibus calcareis (RECH. 16378). In faucibus fluvii Balkh supra Aq Kupruk, 700–800 m (RECH. 16305). – SE: Kandahar: Nördlich von Arghandab, zwischen Kandahar und Ghirishk, 900–1000 m, Steppe (Kn. 315). Im Norden von Kandahar in der Steinsteppe, ca. 1000 m (Kn. 373-b, 2218, 2219-b, Sch. 1). Tshil-sina bei Kandahar, ca. 1000 m (Kn. 344). – E: Sarobi (V. 1894, 1894-a). Panjshir: Ufer des Panjshir-Flusses bei Gulbahar, nächst Charikar, ca. 1700 m (G. 498-b, N. 1950/827). NE: Kataghan: Inter Haibak et jugum Paighah-Kotal (RECH. 16419). Nuristan: Zwischen Asmar und Barikot, ca. 840 m (G. 498-a). Am Ufer eines Mühlbaches bei Barikot, ca. 850 m (G. 499). – Pakistan: Chitral: Drosh, in running water in ditch (B. L. 700).

L. pumila (DESF.) BOR (Syn. *Avena pumila* DESF., *Koeleria pumila* (DESF.) DOMIN). – E: Sarobi (V. 2474). Dakka, an der Strasse von Jallalabad nach Peshawar, ca. 600 m (Kn. 2191).

Trisetaria FORSSK.

T. Cavanillesii (TRIN.) MAIRE (Syn. *Trisetum Cavanillesii* TRIN.) – SW: Herat: Shin Dand, SSW of Herat, ca. 1200 m (K. 4260). – SE: Kandahar: Zwischen Kalat-i

Ghilzai und Kandahar, Steppe (Kn. 209). – E: Kabul: Zwischen Kabul und Tang-i Gharu, sandige Hügel (G. 462). – NE: Nuristan: Gusalak, ca. 1000 m (E. 1534, 2090).

Pooideae-Brachypodieae

Trachynia LINK

T. distachya (L.) LINK (Syn. *Brachypodium distachyon* (L.) P. BEAUV.). – N: Mazar-i Sharif: In fauibus fluvii Balkh supra Aq Kupruk, 700–800 m (RECH. 16304). – SE: Kandahar: In einer Schlucht bei Germaub, am Hilmend nördlich von Ghirishk, Konglomeratboden (Kn. 409-b). Kajkai, NNW of Kandahar (K. 3040). Goldgrube im Nordwesten von Kandahar in der Steinsteppe (SCH. 3). Goldgrube im Norden von Kandahar in der Steinsteppe, ca. 1000 m (Kn. 369-a). – E: Kabul: Schutthalde südöstlich von Sarobi, ca. 1100 m (G. 684, 685). Sarobi, *Cymbopogon*-Steppe (G. 2563-a).

Unteres Papruk-Tal zwischen Papruk und der Mündung in den Baschgal, 1500–2300 m (Kn. 1431). – **C:** Ufer des Salatin-Flusses bei Pschang, nächst Doab, ca. 1700 m (G. 501). – **Pakistan:** Chitral: Yarkhun-Tal bei Mastuj, 2040–2280 m, Brachen, Felder, Ruderalstellen (Kn. 2042). Chitral village, ca. 5000 ft., at edge of fields (ST. 3173). Swat: Inter Madyan et Kulam, ca. 1700 m, substr. granit. (RECH. 19375). Peshawar: Ad confluentes fluvios Kabul et Indus prope Attok, ca. 200 m (RECH. 19649).

Tripogon ROEM. et SCHULT.

T. Hookerianus BOR (Syn. *T. abyssinicus* HOOK. f., Fl. Brit. Ind. 7 (1896) pr. pte., non NEES ex STEUD.). – **E:** Sarobi, (V. 1912, 2561). – **NE:** Nuristan: Shtive, ca. 2600 m (E. 1032). Above Derin (E. 1747).

T. purpurascens DUTHIE (Syn. *T. abyssinicus* HOOK. f., Fl. Brit. Ind. 7 (1896) pr. pte., non NEES ex STEUD.). – **E:** Kurram: Patan, Kurram Valley, Felsspalten (V. 1287). – **NE:** Nuristan: Madschegel-Tal, zwischen Gultscheilam und Kulatam, 1500–1600 m, lichter Eichenbusch am Hang (Kn. 1269).

Pooideae-Festuceae

Catabrosa P. BEAUV.

C. aquatica (L.) P. BEAUV. – **SW:** Herat: 50 km S of Herat, ca. 1600 m (K. 2281). – **E:** Ghazni: Ad lacum Sabzab inter Okak et Behzud (Diwal Kol), ca. 2800 m (RECH. 17900, 17915). Dahan-e Barikak, inter Okak et Behzud (Diwal Kol), ca. 2800 m (RECH. 17982). Kabul: Entwässerungsgraben der Salzwiesen zwischen der Strasse Dehmasang nach Darulfanun und Gusargah, ca. 1770 m (G. 500). Unteres Paghman-Tal, nasse Wiese (N. 1950/819). Qala-e Wazir, inter Sar-i Chashma et jugum Unai,

ca. 2900 m (RECH. 18075). – **C:** Bamian: Koh-i Baba, in latere austro-orientali jugi Hadjigak, ca. 3000 m (RECH. 18535). Ghorat: A Naourak austro-occidentem versus, ca. 2480 m, in humidis (RECH. 18957). – **Pakistan:** Balouchistan: (DUTHIE).

Colpodium TRIN.

C. humile (M. B.) GRISEB. (Syn. *Aira humilis* M. B., *Catabrosa humilis* (M. B.) TRIN.). – **NW:** Sauzak, E of Herat (K. 3970). – **NE:** Nuristan: Parun to Minjan Pass, ca. 4000 m (E. 1274).

Dactylis L.

D. glomerata L. – **NE:** Nuristan: Nishei, ca. 1300 m (E. 809). Auf dem Wege zwischen Aschpi-Pass und dem Ort Kuschtos, 2500–3500 m (N. 1951/699).

D. glomerata L. var. *himalensis* DOMIN – **Pakistan:** Chitral: Golen Gol, ca. 7000 ft. (B. L. 26).

D. glomerata L. var. *hispanica* (ROTH) BOISS. – **E:** Panjshir: Porande-Tal, Seitental des Panjshir-Tales bei Basarak, östlich von Daolana, ca. 2350 m (G. 523). Swat: Kalam, ca. 2200 m, substr. granit. (RECH. 19451, 19459).

Eremopoa ROSHEV.

E. bellula (RGL.) ROSHEV. (Syn. *Festuca bellula* REGEL). – **E:** Ghazni: Ad marginem orientalem altoplanitiae Dasht-e Nawar, ca. 3000 m, in limosis salsis exsiccatis (RECH. 17802). – **C:** Hauz-i Mahiha to Farakulum, ca. 2900 m (K. 2508). Unai-Pass, ca. 3120 m (G. 566, N. 1951/561). Oberhalb Sard-darra in der Koh-i Baba Kette, ca. 4000 m (G. 567). – **NE:** Nuristan: Aoband Kotal, ca. 3000 m (E. 1814).

E. persica (TRIN.) ROSHEV. (Syn. *Poa persica* TRIN.). – **E:** Ghazni: In monte ad occidentem jugi Sardalu inter Qarabagh et Sang-i Masha, ca. 2600 m, substr. gyps. (RECH. 17354). Distr. Bezud: Dahan-e Abdila, 35 km a Sar-i Chashma orientem versus, ca. 2800 m, ad rivulum (RECH. 18594). Tisin, an der Strasse von Kabul nach Jallalabad, Felshang (Kn. 600). Dar-ul Aman Ebene bei Kabul, ca. 1700 m, Flusschotter (Kn. 443). Schutthalde in der Tang-e Gharru, 1600–1700 m (G. 559, Kn. 502-b). Zwischen Kabul und der Tang-e Gharu, ca. 1770 m (G. 560). Paghman-Tal bei Kabul, 2300–2800 m, substr. Gneiss (G. 564, RECH. 17180-a, -b). Oberhalb Paghman, ca. 2470 m, in Felsspalten (G. 568). Koh-i Asmai bei Kabul, ca. 1700 m (Kn. 498). Kabul (V. 1288). – **C:** Qala-e Wazir inter Sar-i Chashma et jugum Unai, ca. 2900 m (RECH. 18102). Kalkberg ENE von Bamian, ca. 2800 m (G. 570).

E. persica (TRIN.) ROSHEV. var. *oxyglumis* (BOISS.) BOR, comb. nov. (Syn. *Poa persica* TRIN. var. *oxyglumis* BOISS., Fl. Or. 5: 610 (1884), *E. oxyglumis* (BOISS.) ROSHEV., Fl. SSSR. 2: 430 (1934).) – **E:** Kabul: Südhang des Aliabader Berges bei Kabul, ca. 1860 m (G. 562). Vorberg des Korogh-Massivs bei Kabul, ca. 1950 m (G. 563). – **C:** Unai-Pass ca. 3120 m, an quelligen Stellen (G. 565).

E. persica (TRIN.) ROSHEV. var. *songarica* (SCHRENK) BOR, The Grasses of Burma, Ceylon, India and Pakistan 532 (1960). (Syn. *Glyceria songarica* SCHRENK, *E. songarica* (SCHRENK) ROSHEV., Fl. SSSR. 2: 431 (1934).) – **E:** Kabul: Seher Darwasah bei Kabul,

ca. 1790 m (G. 561). Oberhalb Beg tut, ca. 2900 m, im Paghman-Gebirge, feuchte Matten (G. 574). – **C:** Hauz-i Mahiha to Farakulum, ca. 2900 m (E. 611). Hauz-i Mahiha, ca. 2600 m (K. 2448). – **NE: Nuristan:** Netshingel, ca. 3500 m (E. 1564). Pashki, ca. 2350 m (E. 611).

As far as the genus *Eremopoa* ROSHEV. is concerned we are prepared to accept two species only *E. persica* (TRIN.) ROSHEV. and *E. bellula* (RGL.) ROSHEV. *E. songarica*, *E. multiradiata* and *E. oxyglumis* are in our opinion only worthy of varietal rank.

Festuca L.

F. arundinacea SCHREB. – **NW:** Sauzak, E of Herat, ca. 2000 m (K. 3039).

F. gigantea (L.) VILL. – **NE: Nuristan:** Oberes Petsch-Tal bei Wama, ca. 1380 m (Kn. 1324). Oberes Badschingel-Tal (Sadel-Tal) bei Gwarnar, ca. 1900 m, Feldränder (Kn. 1201-b). Oberes Petsch-Tal beim Weideplatz Tschetras, ca. 2090 m (Kn. 1304). Unteres Paschgal-Tal bei Kamdesch, 1800–1900 m (Kn. 1455). – **Pakistan: Swat:** Ushu, ca. 2400 m, substr. granit. (RECH. 19516).

F. ovina L. – **E:** Oberhalb des Nedschrab-Tales, zwischen Gulbahar und Sarobi, ca. 3310 m, Berghang (G. 590). Aufstieg vom Schakar-darra zum Hauz-e chaz im Paghmangebirge, ca. 3730 m (G. 591). – **Pakistan: Chitral:** Chumarkhan Pass, ca. 12000 ft., on dry open slopes (St. 2899). Jingeret Gol, W af Drosch, ca. 12000 ft., on rocky slopes (St. 3201). Siru Gol, S of Shah Jinali Pass, ca. 14500 ft., on stony slopes (St. 3056). Golen (Krui Uts), ca. 13500 ft., dry position on cliff (B. L. 120). Ghutbar Gol, ca. 14000 ft., steep slopes (B. L. 46).

F. ovina L. ssp. *Kotschy* (HACK.) ST. YVES – **C:** Bamian: In der Kammregion der Koh-i Baba Kette oberhalb Sard-darra, 4000–4300 m (G. 593, 594). Kammregion der Koh-i Baba, ca. 3780 m (G. 592).

F. ovina L. ssp. *sulcata* HACK. – **C:** Bamian: Nil Kotal, ca. 3200 m (K. 2865). Koh-i Baba, ca. 3900 m (K. 2634). – **NE: Nuristan:** Elasoon (E. 1683).

F. pratensis Huds. – **E:** Kabul: In valle Paghman prope Kabul, 2300–2800 m, substr. Gneiss (G. 598, RECH. 17132). – **C:** Hauz-i Mahiha, Kabul, ca. 2600 m (K. 2436). Qala-e Wazir inter Sar-i Chashma et jugum Unai, ca. 2900 m (RECH. 18079). Im Kamard-Tal westlich von Doab, Weidewiese, ca. 1580 m (G. 597).

F. rubra L. – **C:** Unai-Pass, ca. 3120 m, an quelligen Stellen (G. 595). Ad lacum Band-i Panir, prope Band-i Amir, ca. 2800 m (RECH. 18381). Am Seeufer von Band-e Amir, ca. 2800–2900 m (G. 589, RECH. 18317). – **E:** Panjshir: Porande-Tal, Seitental des Panjshir-Tales bei Baserak, ca. 2800 m (G. 595). **Nuristan:** Kulam, im Kulam-(Munui-) -Tal, ca. 2150 m (Kn. 1038, SCH. 108). Oberes Ramgel-Tal in der Nähe von Puschol, ca. 2300 m (Kn. 1104-b). – **Pakistan: Chitral:** Owir, SE of Tirich Mir, ca. 9000 ft., in irrigated meadow (St. 2770). Baroghil Pass, ca. 12500 ft., at edge of stream (St. 2997). Shower Shun, E of Baroghil Pass, ca. 13000 ft. (St. 3007).

F. rubra L. var. *lachnantha* Ovcz. – **C:** Hauz-i Mahiha to Farakulum, ca. 2900 m (K. 2511). Band-i Amir, ca. 2800 m (K. 2841). – **NE: Nuristan:** Kantivo, ca. 2200 m (E. 669). Pashki, ca. 2300 m (E. 904). – Minjan, Miyan Deh, ca. 2500 m (E. 2083).

Lamarckia MOENCH

L. aurea (L.) MOENCH – **E:** Tisin, an der Strasse von Kabul nach Jallalabad, (Kn. 2187). Dakka, an der Strasse von Jallalabad nach Peshawar (Kn. 2193).

Leucopoa GRISEB.

L. albida (TURCZ.) V. KRECH. et BORR., Fl. SSSR. 2: 495 (1934). (Syn. *Poa albida* TURCZ. ex TRIN., *Leucopoa sibirica* GRISEB., *Festuca sibirica* HACK. ex BOISS.). – **NW:** Chrisht, ca. 2100 m (K. 3620). – **C:** Deh Kundi to Sar-i-Nil, ca. 3000 m (E. 1962). – **Pakistan:** Chitral: Chumarkhan Pass, E of Mastuj, ca. 13000 ft., on dry open slopes (St. 2896). Ghutbar, ca. 14000 ft., on dry steep slopes (B. L. 51).

L. karatavica (BGE.) V. KRECH. et BOBR., Fl. SSSR. 2: 496 (1934). (Syn. *Poa karatavica* BGE., *Festuca karatavica* (BGE). FEDTSCH., *F. subspicata* (RGL.) LIPSKY var. *griffithiana* ST. YVES, *Festuca griffithiana* (ST. YVES) KRIV., *Leucopoa griffithiana* (ST. YVES) OVCZ.). – **E:** Ghazni: Sar-Ab, 40 km a Ghazni boreo-occidentem versus, ca. 2500 m (RECH. 17673). In jugo Kotal Shaghanak, inter Okak et Ghazni, 3400–3500 m (RECH. 17820). Gulbahar bei Charikar (N. 1950/803). Oberhalb Schechan im Nedschrab-Tal, zwischen Gulbahar und Sarobi, ca. 2590 m (G. 599). Gipfel im Korogh-Massiv bei Kabul, ca. 2800 m (G. 601). Mittleres Paghman-Tal, westlich von Kabul (N. 1950/812), 3000–3500 m (N. 1950/239). Ghorband valley, ca. 8900 ft., rocky slopes (M.). Panjshir: Panjshir Valley, W-side of Ajuman pass, ca. 3700 m (HDG. & WDB. 5505). Porande-Tal, Seitental des Panjshir-Tales bei Basarak, ca. 2800 m (G. 602). – **C:** Hauz-i Mahiha, ca. 2500 m (K. 2400). Qala-e Wazir, inter Sar-i Chashma et jugum Unai, ca. 2900 m (RECH. 18100). Unai-Pass, ca. 3150 m (G. 604, N. 1951/517, 551). Inter Bulola et jugum Shibar, 2600–2800 m (RECH. 16842). Kotal-e Nargiz, inter Panjao et Lal, ca. 3000 m (RECH. 18784). Zwischen Bamian und der Koh-i Baba Kette, ca. 3150 m (G. 603). Sar-i Chashma, Koh-i-Baba Range, ca. 2700 m (E. 1835). Koh-i-Baba, ca. 3400 m (K. 3047). – **Nuristan:** Pirdum-Tal, nördlich des Pirdum-Passes, zwischen dem Pass und Puschol, 2300–3000 m (Kn. 1147). Tschitur-Tal, zwischen dem Tschitur-Pass und dem Ramgel-Tal, 2300–3000 m (Kn. 1147).

According to RECHINGER this tufted grass is very common on hillslopes in the high mountain areas of Central Afghanistan, and that it is avoided by cattle in an area where the latter are numerous and every type of vegetable matter is greedily consumed. The dull yellow inflorescences suggested that this grass might be an aluminium-accumulator. Specimens sent to the Government Chemist confirms that this is so and were found to contain 5800 pp. m. aluminium. This is a possible explanation why this grass is not acceptable to grazing animals.

L. Olgae (REGEL) V. KRECH. et BOBR., Fl. SSSR. 2: 495 (1934). (Syn. *Molinia Olgae* REGEL, Act. Hort. Petrop. 7, 2: 625 (1881)). – **C:** In the vicinity of Panjao, ca. 2000 m, limestone slopes (HDG. & WDB. 4925).

Lolium L.

L. perenne L. – **C:** Doab, Felder (V. K-232).

Identification somewhat doubtful (BOR).

L. persicum BOISS. et HOHEN. – **SE:** Kandahar, ca. 1020 m (Kn. 218). – **E:** Kabul: Darulfanum, südwestlich von Kabul (V. 326). Scharenau (Tschaman Wasirabad), ca. 1750 m (G. 716). On direct application to the agent of the Academy: EJNAR MUNKSGAARD, Publishers, 6 Nørregade, Köbenhavn K, a subscription may be taken out for the series *Biologiske Skrifter*. This subscription automatically includes the *Biologiske Meddelelser* in 8vo as well, since the *Meddelelser* and the *Skrifter* differ only in size, not in subject matter. Papers with large formulae, tables etc., will as a rule be published in the *Skrifter* in 4to.

For subscribers or others who wish to receive only those publications which deal with a single group of subjects, a special arrangement may be made with the agent of the Academy, to obtain the published papers included under one or more of the following heads: *Botany*, *Zoology*, *General Biology*.

In order to simplify library cataloguing and reference work, these publications will appear without any special designation as to subject. On the cover of each, however, there will appear a list of the most recent papers dealing with the same subject.

The last published numbers of *Biologiske Skrifter* within the group of **Botany** are the following:

Vol. 13, no. 4. — Vol. 14, no. 4.
